

SNV6520

ADSL Modem Multiservices PSTN Voice

VERSION 1.0

PHILIPS

European Regulations

This product has been designed, tested and manufactured according to the European R&TTE Directive 1999/5/EC.

Following this Directive, this product can be brought into service in the following states:

Hereby, Philips Consumer Electronics, BLC P&A CC, declares that this SNA6500 is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.

August 2005

Disposal of your old product

Your product is designed and manufactured with high quality materials and components, which can be recycled and reused.

When this crossed-out wheeled bin symbol is attached to a product it means the product is covered by the European Directive 2002/96/EC

Please inform yourself about the local separate collection system for electrical and electronic products.

Please act according to your local rules and do not dispose of your old products with your normal household waste. The correct disposal of your old product will help prevent potential negative consequences for the environment and human health.

Introduction

SNV6520

Congratulations on your purchase of the ADSL Modem Multiservices PSTN Voice. We are proud to provide you with a powerful yet simple communication device for connecting your local area network (LAN) to the Internet. For those who want to surf the Internet in the most secure way, this router provides a convenient and powerful solution. The ADSL Modem Multiservices PSTN Voice also enables service providers to provide their residential and small office home office (SOHO) customers with high-quality Telephony service using traditional analog telephones and fax machines.

About the ADSL Modem Multiservices PSTN Voice

The ADSL Modem Multiservices PSTN Voice provides Internet access to multiple users by sharing a single-user account. It is a cost-efficient means for service providers to migrate their customers' traditional analog telephones and fax machines onto IP-based networks. This new technology provides many secure and cost-effective functions. It is simple to configure and can be up and running in minutes.

Telephony over IP

Using Telephony over IP, instead of making calls over the regular telephone network, calls are made over computer (IP) networks, either through your Internet Service Provider's connection or through your local network.

The basic steps involved in Telephony include the conversion of an analog voice signal to digital, the encoding and then compression of the signal into Internet Protocol (IP) packets. The ADSL Modem Multiservices PSTN Voice is equipped with a digital signal processor (DSP), which segments the voice signal into frames and stores them in voice packets. Using the industry standard codecs, G.711, G.723.3 and G.729, these packets are encoded. These IP packets are then transmitted in accordance with International Telecommunications Union specification SIP over the Internet to their destination where the process is reversed.

Important information

- Please install and connect the product in the order as described in the chapter 'Before You Start Guide' only. This assures best installation results with the least technical hassles.
- Please read this guide carefully before using the ADSL Wireless Base Station; and keep it for future reference.
- During set-up and installation, it may be helpful to have the instructions for your PC and other network components at hand.

Safety Precautions

- Do not expose the product to excessive moisture, rain, sand or heat sources.
- The product should not be exposed to dripping or splashing. No object filled with liquids, such as vases, should be placed on the product.
- Keep the product away from domestic heating equipment and direct sunlight.
- Allow a sufficient amount of free space all around the product for adequate ventilation.
- Do not open this product. Contact your retailer if you experience technical difficulties.

Environmental information

All redundant packing material has been omitted. We have done our utmost to make the packaging easily separable into three mono materials: cardboard (box), polystyrene foam (buffer) and polyethylene (bags, protective foam sheet). Your set consists of materials that can be recycled if disassembled by a specialised company. Please observe the local regulations regarding the disposal of packing materials, exhausted batteries and old equipment.

Disclaimer

This product is provided by 'Philips' 'as is' and without any express or implied warranty of any kind of warranties, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose are disclaimed. In no event shall Philips be liable for any direct, indirect, incidental, special, exemplary, or consequential damages (including, but not limited to, procurement of substitute goods or services; loss of information, data, or profits; or business interruption) howsoever caused and on any theory of liability, whether in contract, strict liability, or tort (including negligence or otherwise) arising in any way out of the use of inability to use this product, even if advised of the possibility of such damages. Philips further does not warrant the accuracy or completeness of the information, text, graphics, illustrative examples links or other items can be deviated of the product.

Before installing the ADSL Modem Multiservices PSTN Voice, verify that you have all the items listed under 'Package Contents.' If any of the items are missing or damaged, contact your local distributor. Also be sure that you have all the necessary cabling before installing the ADSL Modem Multiservices PSTN Voice. After installing the ADSL Modem Multiservices PSTN Voice, refer to 'Configuring the ADSL Modem Multiservices PSTN Voice'.

Package Contents

After unpacking the ADSL Modem Multiservices PSTN Voice, check the contents of the box to be sure you have received the following components:

- ADSL Modem Multiservices PSTN Voice
- Power adapter
- One CAT-5 Ethernet cable
- Telephone patch cable
- One driver and documentation CD

Immediately inform your dealer in the event of any incorrect, missing, or damaged parts. If possible, please retain the carton and original packing materials in case there is a need to return the product.

System Requirements

You must meet the following minimum requirements:

- Internet access from your Internet Service Provider (ISP) using an ADSL modem.
- A PC using a dynamic IP address assigned via DHCP, as well as a gateway server address and DNS server address from your service provider.
- A computer equipped with a 10 Mbps, 100 Mbps, or 10/100 Mbps Fast Ethernet card.
- TCP/IP network protocols installed on each PC that will access the Internet.
- A Java-enabled web browser, such as Microsoft Internet Explorer 5.0 or above installed on one PC at your site for configuring the ADSL Modem Multiservices PSTN Voice.

Hardware Description

The ADSL Modem Multiservices PSTN Voice contains an integrated ADSL modem and connects to the Internet or to a remote site using its RJ-11 port. It can be connected directly to your PC or to a local area network using the Fast Ethernet LAN ports. There is also one USB 1.1 connection to connect to your printer or a secondary storage device.

Access speed to the Internet depends on your service type. Full-rate ADSL provides up to 8 Mbps downstream and 640 kbps upstream. G.lite (or splitterless) ADSL provides up to 1.5 Mbps downstream and 512 kbps upstream. However, you should note that the actual rate provided by specific service providers might vary dramatically from these upper limits.

The ADSL Modem Multiservices PSTN Voice comes with two FXS ports to connect with a phone or fax, turning your regular phone into an IP phone. Through your telephone or FAX, you can dial out through the gateway to another Telephony gateway or IP Phone.

Data passing between devices connected to your local area network can run at up to 100 Mbps over the four Fast Ethernet ports.

The ADSL Modem Multiservices PSTN Voice connections are described in the following figure and table.

Item	Description
ADSL Port	ADSL port (RJ-11). Connect your ADSL line to this port.
LAN Ports	Fast Ethernet ports (RJ-45). Connect devices on your local area network to these ports (i.e., a PC, hub, or switch).
Power Switch	Push to power on the device.
Power Inlet	Connect the included power adapter to this inlet. <i>Warning: Using the wrong type of power adapter may cause damage.</i>
Reset Button	Use this button to reset the power and restore the default factory settings. To reset without losing configuration settings, see 'Reset' on page 61.
USB Port	Connect to print server.
FXS Ports	RJ-11 port. Connect to standard analog telephone set or fax Machine.

LEDs

The ADSL Modem Multiservices PSTN Voice includes an LED display for system power and port indications that simplifies installation and network troubleshooting. The power and port LED indicators are explained by the following figure and table.

Item	Status	Description
1. Phone2, 1	ON	When Phone is OFF-Hook talking on a Call
	Blinking Green	On an Incoming Telephone Call when it rings the phone or in call waiting stage
	Off	When modem is having no communication on ADSL or Internet Telephony
2. TEL	Solid Green	When Telephone registration is successful
	Off	When there is no connection
3. USB	Solid Green	When USB device is up and connected
	Off	When there is no connection
4. LAN 1, 2, 3, 4	Green	When connected to each port on the LAN
	Blinking green	When there is activity on each port
5. WL	Off	Wireless disabled
	On	Wireless enabled
	Blinking	Wireless traffic
6. On Line	Green	When Link is Up
	Blinking	When sending and receiving data
7. ADSL	Blinking green	When initializing
	Green	When initialized
8. PWR	Green	When power is on

Hardware Installation

ADSL Connection

Connect your ADSL line to this port.

Fast Ethernet Connection

Connect a PC to one of the RJ-45 ports on the ADSL Modem Multiservices PSTN Voice with the provided network cable. When inserting an RJ-45 plug, be sure the tab on the plug clicks into position to ensure that it is properly seated.

The LAN ports are dual-speed RJ-45 ports. They support auto-negotiation, so the optimum communication mode (half or full duplex) and data rate (10 Mbps or 100 Mbps) are selected automatically.

USB Connection

Using the USB port, connect to a secondary storage device or printer. This port allows you to, for example, share your USB printer over the network without needing to leave a host PC switched on.

FXS Connection

Connect a standard analog telephone set or fax machine to either of the FXS ports on the rear panel. The FXS ports are like your local phone service provider in that they can generate and provide a ring signal.

Note: When you have connected a device to the FXS port as you will hear a dial tone provided by the FXS port once the handset is off-hook.

ISP Settings

Please collect the following information from your ISP before setting up the ADSL Modem Multiservices PSTN Voice:

- ISP account user name and password
- Protocol, encapsulation and VPI/VCI circuit numbers
- DNS server address
- IP address, subnet mask and default gateway (for fixed IP users only)

Connect the System

The ADSL Modem Multiservices PSTN Voice can be positioned at any convenient location in your office or home. No special wiring or cooling requirements are needed. You should, however, comply with the following guidelines:

- Keep the ADSL Modem Multiservices PSTN Voice away from any heating devices.
- Do not place the ADSL Modem Multiservices PSTN Voice in a dusty or wet environment.

You should also remember to turn off the power, remove the power cord from the outlet, and keep your hands dry when you install the ADSL Modem Multiservices PSTN Voice.

Connect the ADSL Line

Run standard telephone cable from the wall jack providing ADSL service to the RJ-11 ('ADSL') port on your ADSL Modem Multiservices PSTN Voice. When inserting an ADSL RJ-11 plug, be sure the tab on the plug clicks into position to ensure that it is properly seated. If you are using splitterless ADSL service, be sure you add low-pass filters between the ADSL wall jack and your telephones. (These filters pass voice signals through but filter data signals out.)

Phone Line Configuration

Installing a Full-Rate Connection

If you are using a full-rate (G.dmt) connection, your service provider will attach the outside ADSL line to a data/voice splitter. In this case you can connect your phones and computer directly to the splitter as shown below:

Installing a Splitterless Connection

If you are using a splitterless (G.lite) connection, then your service provider will attach the outside ADSL line directly to your phone system. In this case you can connect your phones and computer directly to the incoming ADSL line, but you will have to add low-pass filters to your phones as shown below:

Attach to Your Network Using Ethernet Cabling

The LAN ports on the ADSL Modem Multiservices PSTN Voice auto-negotiates the connection speed to 10 Mbps Ethernet or 100 Mbps Fast Ethernet, as well as the transmission mode to half duplex or full duplex.

Use twisted-pair cabling to connect any of the LAN ports on the ADSL Modem Multiservices PSTN Voice to an Ethernet adapter on your PC. Otherwise, cascade the LAN port on the ADSL Modem Multiservices PSTN Voice to an Ethernet hub or switch, and then connect your PC or other network equipment to the hub or switch. When inserting an RJ-45 connector, be sure the tab on the connector clicks into position to ensure that it is properly seated.

Warning: Do not plug a phone jack connector into an RJ-45 port. This may damage the ADSL Modem Multiservices PSTN Voice. Instead, use only twisted-pair cables with RJ-45 connectors that conform with FCC standards.

Notes:

- Use 100-ohm shielded or unshielded twisted-pair cable with RJ-45 connectors for all Ethernet ports. Use Category 3, 4, or 5 for connections that operate at 10 Mbps, and Category 5 for connections that operate at 100 Mbps.
- Make sure each twisted-pair cable length does not exceed 100 meters (328 feet).

Connect the Power Adapter

Plug the power adapter into the power socket on the side panel of the ADSL Modem Multiservices PSTN Voice, and the other end into a power outlet.

Check the power indicator on the front panel is lit.

If the power indicator is not lit, refer to the chapter 'Troubleshooting'.

In case of a power input failure, the ADSL Modem Multiservices PSTN Voice will automatically restart and begin to operate once the input power is restored.

If the ADSL Modem Multiservices PSTN Voice is properly configured, it will take about 30 seconds to establish a connection with the ADSL service provider after powering up. During this time the Sync indicator will flash. After the ADSL connection has been established, the ADSL Sync LED will stay on.

After completing hardware setup by connecting all your network devices, you need to configure your computer to connect to the ADSL Modem Multiservices PSTN Voice. First determine how your ISP issues your IP address. Many ISPs issue these numbers automatically using Dynamic Host Configuration Protocol (DHCP). Other ISPs provide a static IP address and associated numbers, which you must enter manually. How your ISP assigns your IP address determines how you need to configure your computer.

Depending on your operating system see:
'Configuring Your Computer in Windows 2000' on page 11,
'Configuring Your Computer in Windows XP' on page 14, or
'Configuring Your Macintosh Computer' on page 16.

TCP/IP Configuration

To access the Internet through the ADSL Modem Multiservices PSTN Voice, you must configure the network settings of the computers on your LAN to use the same IP subnet as the ADSL Modem Multiservices PSTN Voice. The default network settings for the ADSL Router are:

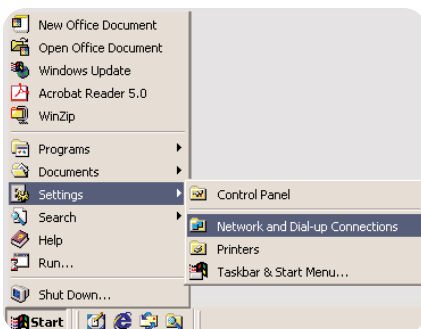

IP Address: 192.168.2.1
Subnet Mask: 255.255.255.0

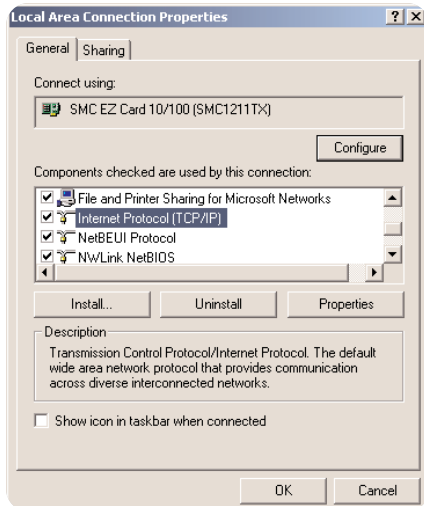

Note: These settings can be changed to fit your network requirements, but you must first configure at least one computer to access the ADSL Modem Multiservices PSTN Voice's web configuration interface in order to make the required changes. (See 'Configuring the ADSL Modem Multiservices PSTN Voice' for instruction on configuring the ADSL Modem Multiservices PSTN Voice.)

Configuring Your Computer in Windows 2000

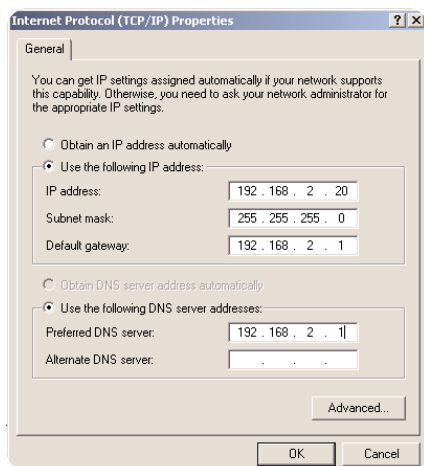

DHCP IP Configuration

1. On the Windows desktop, click Start/Settings/ Network and Dial-Up Connections.
2. Click the icon that corresponds to the connection to your ADSL Modem Multiservices PSTN Voice.
3. The connection status screen will open. Click Properties.

1. Double-click Internet Protocol (TCP/IP).

2. If 'Obtain an IP address automatically' and 'Obtain DNS server address automatically' are already selected, your computer is already configured for DHCP. If not, select these options. Click Cancel to close each window.

Obtain IP Settings From Your ADSL Modem Multiservices PSTN Voice

Now that you have configured your computer to connect to your ADSL Modem Multiservices PSTN Voice, it needs to obtain new network settings. By releasing old DHCP IP settings and renewing them with settings from your ADSL Modem Multiservices PSTN Voice, you can verify that you have configured your computer correctly.

1. On the Windows desktop, click Start/Programs/ Accessories/Command Prompt.
2. In the Command Prompt window, type 'IPCONFIG /RELEASE' and press the ENTER key.

1. Type 'IPCONFIG /RENEW' and press the ENTER key. Verify that your IP Address is now 192.168.2.xxx, your Subnet Mask is 255.255.255.0 and your Default Gateway is 192.168.2.254. These values confirm that your ADSL Modem Multiservices PSTN Voice is functioning.
2. Type 'EXIT' and press the ENTER key to close the Command Prompt window.

```

C:\Documents and Settings\k_wu>ipconfig/release

Windows 2000 IP Configuration

IP address successfully released for adapter "Local Area Connection"

C:\Documents and Settings\k_wu>ipconfig/renew

Windows 2000 IP Configuration

Ethernet adapter Local Area Connection 2:

    Connection-specific DNS Suffix  . : 
    IP Address. . . . . : 192.168.1.2
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 192.168.1.1

C:\Documents and Settings\k_wu>

```

Manual IP Configuration

1. Follow steps 1-4 in 'DHCP IP Configuration' on page 11.
2. Select 'Use the following IP address automatically.' Enter an IP address based on the default network 192.168.2.x (where x is between 2 and 254), use 255.255.255.0 for the subnet mask and the IP address of the ADSL Modem Multiservices PSTN Voice (default: 192.168.2.1) for the Default gateway field.
3. Select 'Use the following DNS server addresses.'
4. Enter the IP address for the ADSL Modem Multiservices PSTN Voice in the Preferred DNS server field. This automatically relays DNS requests to the DNS server(s) provided by your ISP. Otherwise, add a specific DNS server into the Alternate DNS Server field and click OK to close the dialog boxes.
5. Record the configured information in the following table.

TCP/IP Configuration Setting

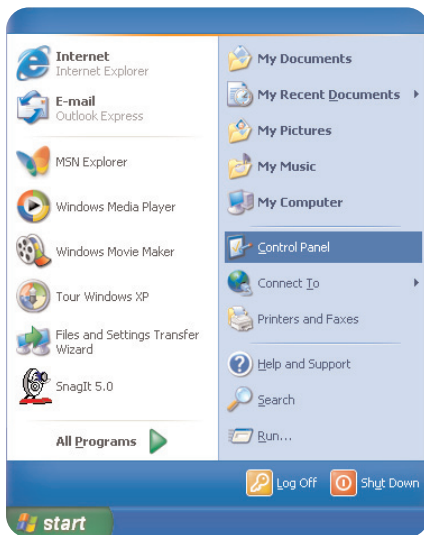

IP Address _____
 Subnet Mask _____
 Preferred DNS Server _____
 Alternate DNS Server _____
 Default Gateway _____

Disable HTTP Proxy

You need to verify that the 'HTTP Proxy' feature of your web browser is disabled. This is so that your browser can view the ADSL Modem Multiservices PSTN Voice's HTML configuration pages. Your computer is now configured to connect to the ADSL Modem Multiservices PSTN Voice.

Configuring Your Computer in Windows XP DHCP IP Configuration

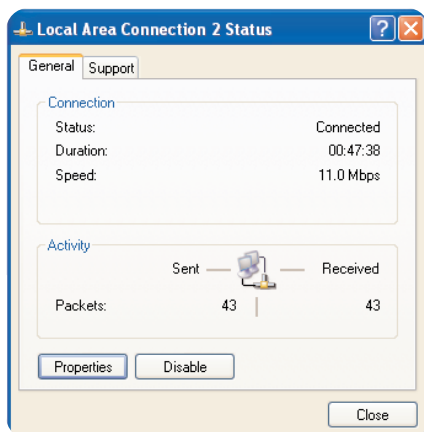

- On the Windows desktop, click Start/Control Panel.

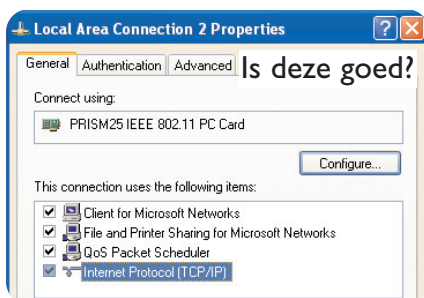

- In the Control Panel window, click Network and Internet Connections.

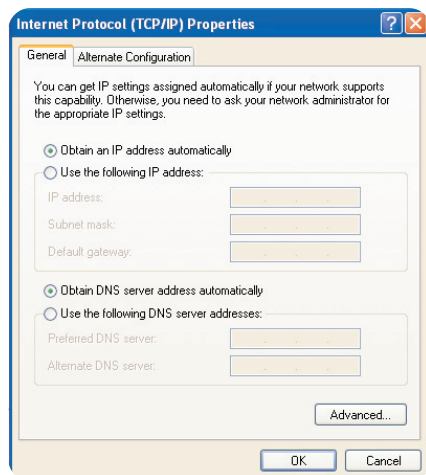

- The Network Connections window will open. Locate and double-click the Local Area Connection icon for the Ethernet adapter that is connected to the ADSL Modem Multiservices PSTN Voice.

- In the connection status screen, click Properties.

- Double-click Internet Protocol (TCP/IP).

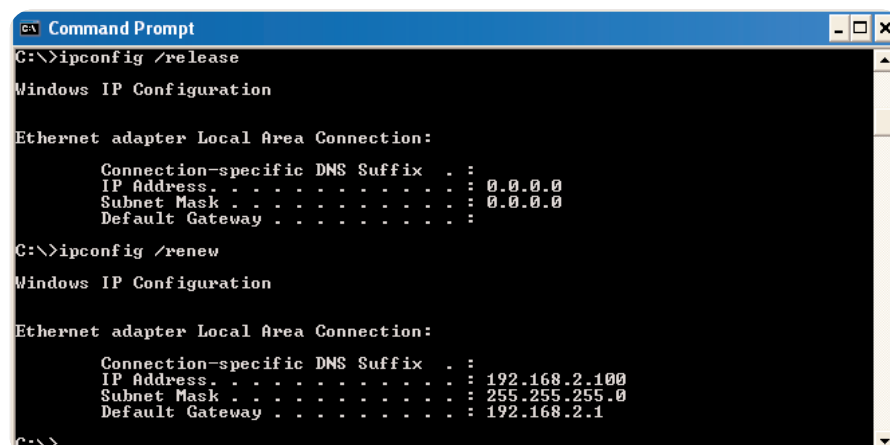

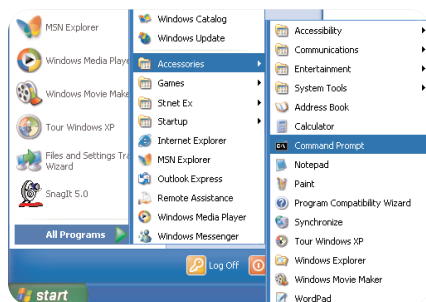

- If 'Obtain an IP address automatically' and 'Obtain DNS server address automatically' are already selected, your computer is already configured for DHCP. Click Cancel to close each window.

Obtain IP Settings from Your ADSL Modem Multiservices PSTN Voice

Now that you have configured your computer to connect to your ADSL Modem Multiservices PSTN Voice, it needs to obtain new network settings. By releasing old DHCP IP settings and renewing them with settings from your ADSL Modem Multiservices PSTN Voice, you can verify that you have configured your computer correctly.

1. On the Windows desktop, click Start/Programs/Accessories/ Command Prompt.
2. In the Command Prompt window, type 'IPCONFIG /RELEASE' and press the ENTER key.

3. Type 'IPCONFIG /RENEW' and press the ENTER key. Verify that your IP Address is now 192.168.2.xxx, your Subnet Mask is 255.255.255.0 and your Default Gateway is 192.168.2.1. These values confirm that your ADSL Modem Multiservices PSTN Voice is functioning.

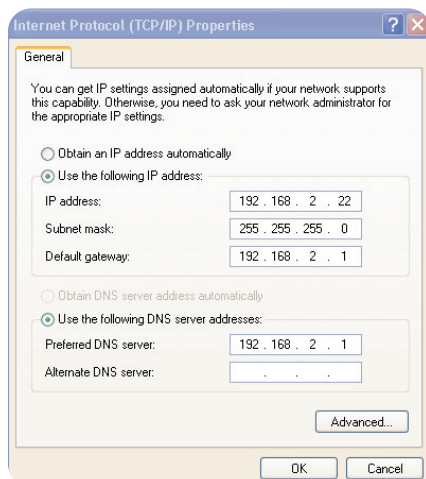

Type 'EXIT' and press the ENTER key to close the Command Prompt window.

Your computer is now configured to connect to the ADSL Modem Multiservices PSTN Voice.

Manual IP Configuration

1. Follow steps 1-5 in 'DHCP IP Configuration' on page 14.
2. Select 'Use the following IP Address.'
3. Enter an IP address based on the default network 192.168.2.x (where x is between 2 and 254), use 255.255.255.0 for the subnet mask, and the IP address of the ADSL Modem Multiservices PSTN Voice (default: 192.168.2.1) for the Default gateway field.
4. Select 'Use the following DNS server addresses.'
5. Enter the IP address for the ADSL Modem Multiservices PSTN Voice in the Preferred DNS server field. This automatically relays DNS requests to the DNS server(s) provided by your ISP. Otherwise, add a specific DNS server into the Alternate DNS Server field and click OK to close the dialog boxes.
6. Record the configured information in the following table.

TCP/IP Configuration Setting

IP Address _____
 Subnet Mask _____
 Preferred DNS Server _____
 Alternate DNS Server _____
 Default Gateway _____

Disable HTTP Proxy

You need to verify that the 'HTTP Proxy' feature of your web browser is disabled. This is so that your browser can view the ADSL Modem Multiservices PSTN Voice's HTML configuration pages.

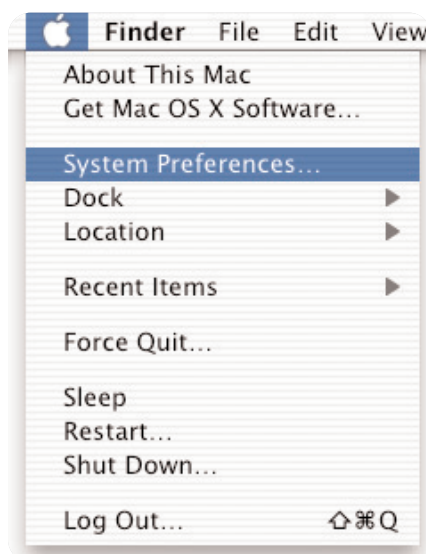

Your computer is now configured to connect to the ADSL Modem Multiservices PSTN Voice.

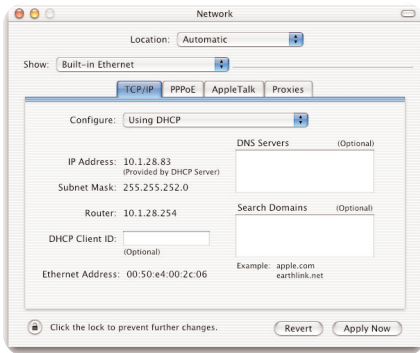

Configuring Your Macintosh Computer

You may find that the instructions here do not exactly match your operating system. This is because these steps and screen shots were created using Mac OS 10.2. Mac OS 7.x and above are similar, but may not be identical to Mac OS 10.2.

Follow these instructions:

- Pull down the Apple Menu. Click System Preferences.
- Double-click the Network icon in the Systems Preferences window.

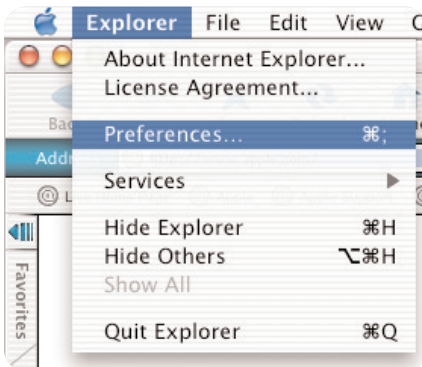

- If 'Using DHCP Server' is already selected in the Configure field, your computer is already configured for DHCP. If not, select this Option.
- Your new settings are shown in the TCP/IP tab. Verify that your IP Address is now 192.168.2.xxx, your Subnet Mask is 255.255.255.0 and your Default Gateway is 192.168.2.1. These values confirm that your ADSL Modem Multiservices PSTN Voice is functioning.
- Close the Network window.

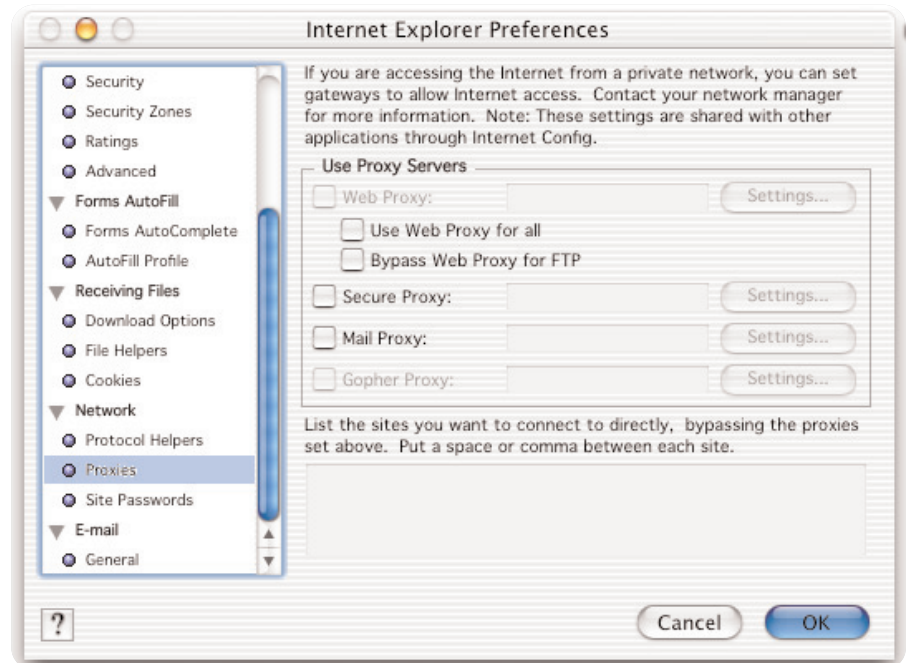

Now your computer is configured to connect to the ADSL Modem Multiservices PSTN Voice.

Disable HTTP Proxy

You need to verify that the 'HTTP Proxy' feature of your web browser is disabled. This is so that your browser can view the ADSL Modem Multiservices PSTN Voice's HTML configuration pages. The following steps are for Internet Explorer.

- Open Internet Explorer and click the Stop button. Click Explorer/Preferences.
- In the Internet Explorer Preferences window, under Network, select Proxies.
- Uncheck all check boxes and click OK.

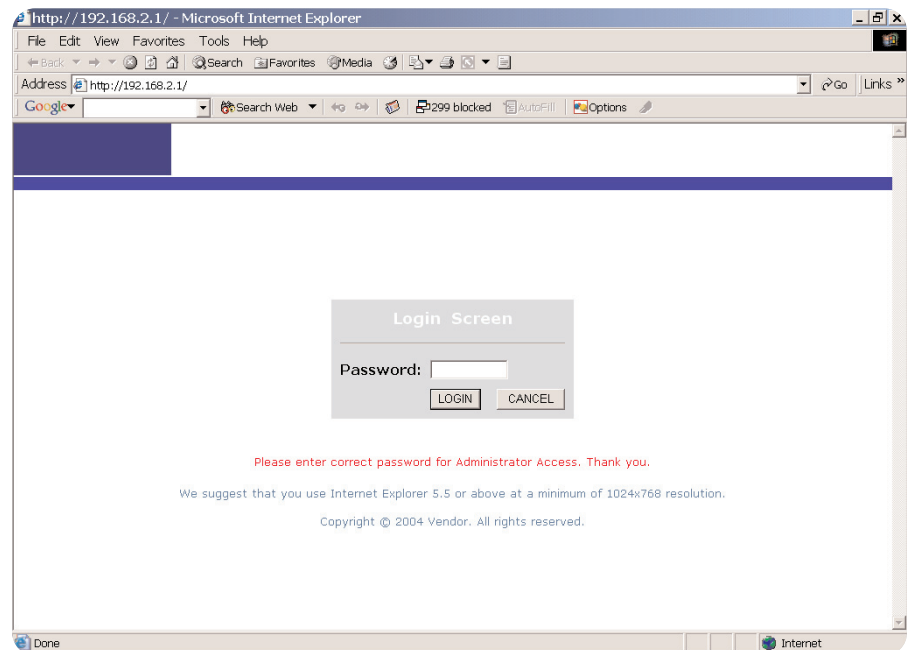

Configuring The ADSL Modem Multiservices PSTN Voice

After you have configured TCP/IP on a client computer, use a web browser to configure the ADSL Modem Multiservices PSTN Voice. The ADSL Modem Multiservices PSTN Voice can be configured by any Java-supported browser such as Internet Explorer 4.0 or above. Using the web management interface, you may configure the ADSL Modem Multiservices PSTN Voice and view statistics to monitor network activity.

To access the ADSL Modem Multiservices PSTN Voice's management interface, enter the IP address of the ADSL Modem Multiservices PSTN Voice in your web browser: <http://192.168.2.1>

(The ADSL Modem Multiservices PSTN Voice automatically switches to Port 88 for management access.) Then click LOGIN. (By default there is no password.)

Navigating the Web Browser Interface

The ADSL Modem Multiservices PSTN Voice's management interface consists of a Setup Wizard and an Advanced Setup section.

Setup Wizard: Use the Setup Wizard if you want to quickly set up the ADSL Modem Multiservices PSTN Voice. Go to 'Setup Wizard'.

Advanced Setup: Advanced Setup supports more advanced functions like hacker attack detection, IP and MAC address filtering, virtual server setup, virtual DMZ host, as well as other functions. Go to 'Advanced Setup'.

Making Configuration Changes

Configurable parameters have a dialog box or a drop-down list. Once a configuration change has been made on a page, be sure to click the 'SAVE SETTINGS' or 'NEXT' button at the bottom of the page to enable the new setting.

Note: To ensure proper screen refresh after a command entry, be sure that Internet Explorer 5.0 is configured as follows: Under the menu Tools/Internet Options/General/Temporary Internet Files/Settings, the setting for 'Check for newer versions of stored pages' should be 'Every visit to the page.'

Setup Wizard

Quickstart

The first item in the Setup Wizard is Quickstart. The ADSL Wireless Base Station displays the Quickstart Web page.

Enter the Username and Password supplied by your Internet Service Provider.

- **Enable Wireless**

The wireless function is enabled by default. If you want to disable the wireless function of the ADSL Wireless Base Station, you can uncheck the 'Enable Wireless' checkbox.

- **Enable Broadcast**

The ADSL Wireless Base Station broadcasts its Wireless ID by default. This means that the SSID will appear as an available network when scanned for by wireless-enabled devices.

If you uncheck this checkbox, you must manually type in the identical SSID in your wireless devices or clients in order to connect to the ADSL Wireless Base Station network.

- **Wireless ID (SSID)**

The Wireless ID is preset to 'WiFi_xx?'. The 'xx' corresponds with an unique number in your ADSL Wireless Base Station. You can either leave it as is, or change it. On client PCs' software, this might also be called the Network Name. The Wireless ID is used to identify this particular wireless network. Please refer to the manual of your wireless client on how to connect to the ADSL Wireless Base Station.

- **Telephone Service**

The telephone service is disabled by default. If you want to enable the Telephone function of the ADSL Wireless Base Station you can check the enable box to turn on the 'Telephone Service' function.

- **Click the 'Save Settings/Next' button.**

Once you leave your Telephone Service disabled please click on 'Save Settings' and continue. You can now surf to your favorite websites by typing an URL in your browser's location box or by selecting one of your favorite Internet bookmarks. If you enabled the Telephone Service please click on 'Next' and continue with Step 'Phone Number Selection'.

Configure your Telephone settings

1. Phone Number Selection

Please indicate which number you want to use and click 'Next'. For this example scenario with '3 Phone numbers' has been chosen to explain the generic configuration.

ADSL Parameters and Status

This page displays ADSL-related parameters and status.

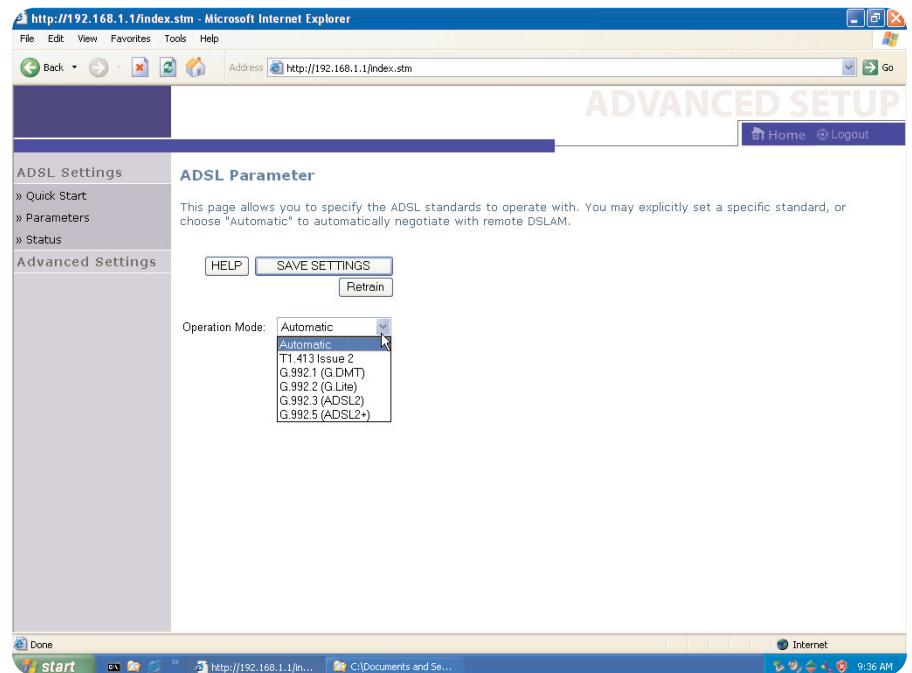

start

Internet

4:45 PM

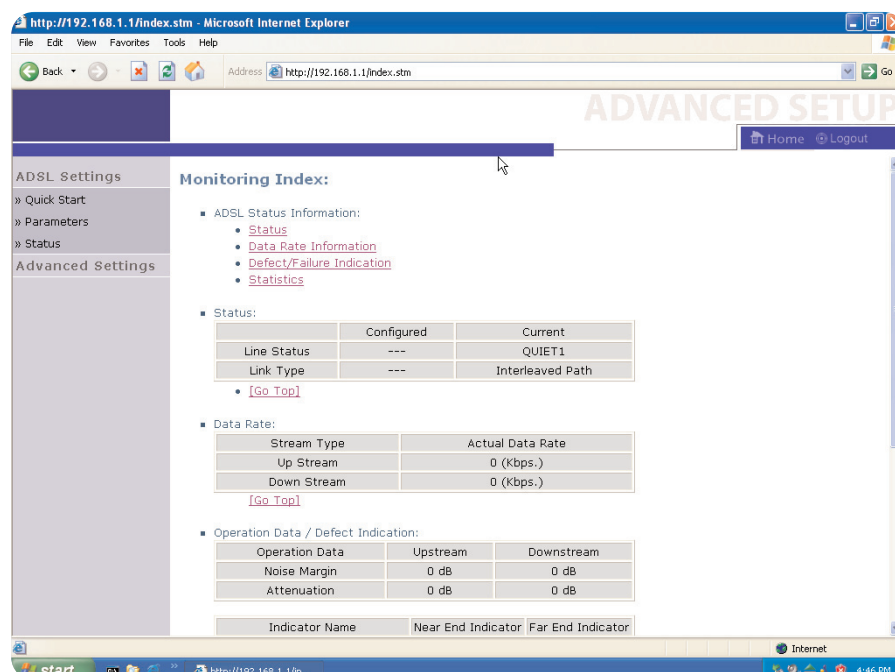

This page is designed for the engineer to test the ADSL loop condition. Therefore, it is advised that users should not change the settings here at all.

Status

The Status screen displays information on connection line status, data rate, operation data and defect indication, and statistics.

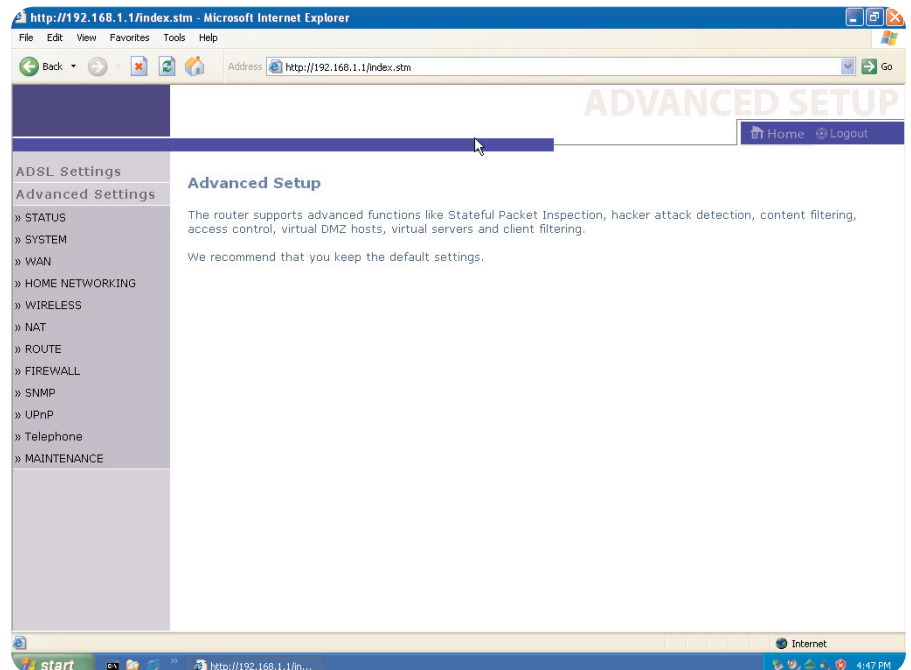

The following items are included on the ADSL status page:

Parameter	Description
Status	
• Line Status	Shows the current status of the ADSL line connection.
• Link Type	Two types of link: Fast path and Interleaved path.
Data Rate	
• Upstream	Maximum upstream data rate.
• Downstream	Maximum downstream data rate.
Operation Data/ Defect Indication	
• Noise Margin	Maximum upstream and downstream noise margin.
• Attenuation	Maximum reduction in the strength of the upstream and downstream signal.
• Fast Path FEC Correction	There are two latency paths that may be used: fast and interleaved. For either path, a forward error correction (FEC) scheme is employed to ensure higher data integrity. For maximum noise immunity, an interleaver may be used to supplement FEC.
• Interleaved Path FEC	An interleaver is basically a buffer used to introduce a delay, allowing for Correction additional error correction techniques to handle noise. Interleaving slows the data flow and may not be optimal for real-time signals such as video transmission.
Fast Path CRC Error	The number of Fast Path Cyclic Redundancy Check errors.
Interleaved Path CRC Error	The number of Interleaved Path Cyclic Redundancy Check errors.
Loss of Signal Defect	Momentary signal discontinuities.
Fast Path HEC Error	Fast Path Header Error Concealment errors.
Interleaved Path HEC	Error Interleaved Path Header Error Concealment errors.
Statistics	(Superframes represent the highest level of data presentation. Each superframe contains regular ADSL frames, one of which is used to provide superframe synchronization, identifying the start of a superframe. Some of the remaining frames are also used for special functions.)
• Received cells	Number of cells received.
• Transmitted cells	Number of cells transmitted.

Advanced Setup

Clicking the Home icon returns you to the home page. The Main Menu links are used to navigate to other menus that display configuration parameters and statistics.

The ADSL Modem Multiservices PSTN Voice's advanced management interface contains 14 main menu items as described in the following table.

Menu: Description

- **System:** Sets the local time zone, the password for administrator access, the IP address of a PC that will be allowed to manage the ADSL Modem Multiservices PSTN Voice remotely, and the IP address of a Domain Name Server.
- **WAN:** Specifies the Internet connection settings.
- **LAN:** Sets the TCP/IP configuration for the ADSL Modem Multiservices PSTN Voice LAN interface and DHCP clients.
- **Wireless:** Configures the radio frequency, SSID, and security for wireless communications.
- **NAT:** Shares a single ISP account with multiple users, sets up virtual servers.
- **Route:** Sets routing parameters and displays the current routing table.

Menu: Description

- **Firewall:** Configures a variety of security and specialized functions including: Access Control, URL blocking, Internet access control scheduling, Intruder detection, and DMZ.
- **SNMP:** Community string and trap server setting.
- **ADSL:** Sets the ADSL operation type and shows the ADSL status.
- **Telephony:** Configures Telephony settings for the ADSL Modem Multiservices PSTN Voice.
- **QoS:** Allows you to optimize voice quality by prioritizing voice over data traffic.
- **File:** Allows you to enable or disable file server functionality. Server
- **Tools:** Contains options to back up and restore the current configuration, restore all configuration settings to the factory defaults, update system firmware, or reset the system.
- **Status:** Provides WAN connection type and status, firmware and hardware version numbers, system IP settings, as well as DHCP, NAT, and firewall information.
Displays the number of attached clients, the firmware versions, the physical MAC address for each media interface, and the hardware version and serial number.
Shows the security and DHCP client log.

Making Configuration Changes

Configurable parameters have a dialog box or a drop-down list. Once a configuration change has been made on a page, click the 'SAVE SETTINGS' or 'NEXT' button at the bottom of the page to make the new settings active.

Note: To ensure proper screen refresh after a command entry, check that Internet Explorer 5.0 is configured as follows: Under the menu Tools/Internet Options/General/Temporary Internet Files/Settings, the setting for 'Check for newer versions of stored pages' should be 'Every visit to the page.'

System Settings

Time Settings

The screenshot shows the 'Time Settings' page within the 'ADVANCED SETUP' section of the ADSL Modem Multiservices PSTN Voice web interface. The left sidebar lists various settings categories, with 'Time Settings' selected. The main content area includes a 'Set Time Zone' section with a dropdown menu set to '(GMT+01:00)Brussels, Copenhagen, Paris, Vilnius'. Below this is the 'Configure Time Server (NTP)' section, which has a checkbox for 'Enable Automatic Time Server Maintenance' that is checked. It also includes fields for 'Primary Server' (129.132.2.21 - Europe) and 'Secondary Server' (130.149.17.8 - Europe). At the bottom right are buttons for 'HELP', 'SAVE SETTINGS', and 'CANCEL'.

Set the time zone and time server for the ADSL Modem Multiservices PSTN Voice. This information is used for log entries and client access control.

Check 'Enable Automatic Time Server Maintenance' to automatically maintain the ADSL Modem Multiservices PSTN Voice's system time by synchronizing with a public time server over the Internet. Then configure two different time servers by selecting the options in the Primary Server and Secondary Server fields.

Password Settings

Use this page to restrict access based on a password. By default, there is no password. For security you should assign one before exposing the ADSL Modem Multiservices PSTN Voice to the Internet.

The screenshot shows the 'Password Settings' page within the 'ADVANCED SETUP' section of the ADSL Modem Multiservices PSTN Voice web interface. The left sidebar lists various settings categories, with 'Password Settings' selected. The main content area includes a 'Set a password to restrict management access to the router.' section. It contains three input fields: 'Current Password', 'New Password', and 'Re-Enter Password for Verification'. To the right of these fields is an 'Idle Time Out' section with a dropdown menu set to '10 Min' and a note '(Idle Time = 0 : NO Time Out)'. At the bottom right are buttons for 'HELP', 'SAVE SETTINGS', and 'CANCEL'.

Passwords can contain from 3 to 12 alphanumeric characters and are not case sensitive.

Note: If your password is lost, or you cannot gain access to the user interface, press the reset button (colored blue) on the rear panel (holding it down for at least five seconds) to restore the factory defaults. (By default there is no password.)

Enter a maximum Idle Time Out (in minutes) to define a maximum period of time an inactive login session will be maintained. If the connection is inactive for longer than the maximum idle time, it will be logged out, and you will have to login to the web management system again. (Default: 10 minutes)

Remote Management

By default, management access is only available to users on your local network. However, you can also manage the ADSL Modem Multiservices PSTN Voice from a remote host by entering the IP address of a remote computer on this screen. Check the Enabled check box, and enter the IP address of the Host Address and click 'SAVE SETTINGS.'

The screenshot shows the 'Remote Management' configuration page. The browser address bar shows 'http://192.168.1.1/aiindex.stm'. The left sidebar lists various settings categories, with 'Remote Management' selected. The main content area has a title 'Remote Management' and a description: 'Set the remote management of the router. If you want to manage the router from a remote location (outside of the local network), you must also specify the IP address of the remote PC.' Below this is a table with two columns: 'Host Address' and 'Enabled'. The 'Host Address' column contains four input fields, each with a '0' entered. The 'Enabled' column contains an unchecked checkbox. At the bottom right are three buttons: 'HELP', 'SAVE SETTINGS', and 'CANCEL'.

Host Address	Enabled
0 . 0 . 0 . 0	<input type="checkbox"/>

Note: If you check 'Enabled' and specify an IP address of 0.0.0.0, any host can manage the ADSL Modem Multiservices PSTN Voice.

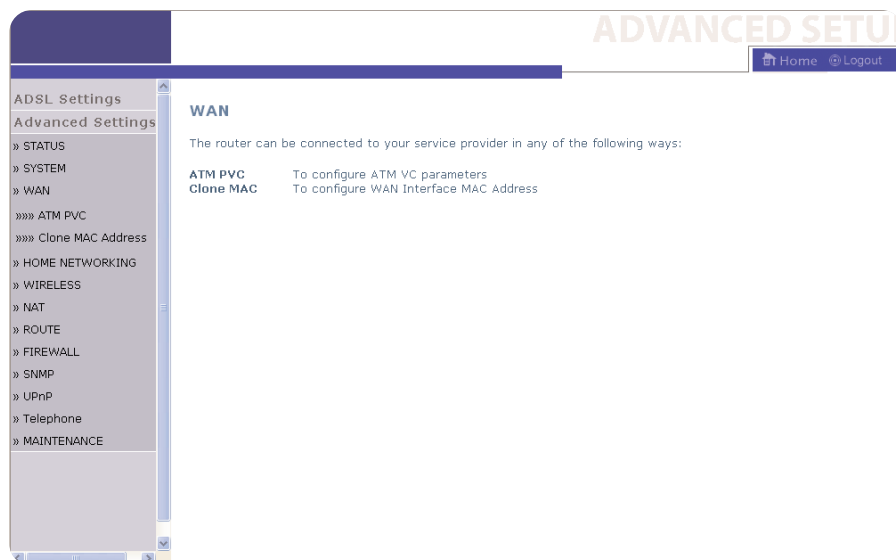

For remote management via WAN IP address you need to connect using port 8080. Simply enter WAN IP address followed by :8080 in the address field of your web browser, for example, 212.120.68.20:8080.

DNS

The screenshot shows the 'DNS' configuration page. The browser address bar shows 'http://192.168.1.1/ai...'. The left sidebar lists various settings categories, with 'DNS' selected. The main content area has a title 'DNS' and a description: 'A Domain Name Server (DNS) is an index of IP addresses and Web addresses. If you type a Web address into your browser, such as selfcare.belgacom.net/, a DNS server will find that name in its index and find the matching IP address: xxx.xxx.xxx.xxx. Most ISPs provide a DNS server for speed and convenience. Since your Service Provider may connect to the Internet with dynamic IP settings, it is likely that the DNS server IP's are also provided dynamically. However, if there is a DNS server that you would rather use, you need to specify the IP address here.' Below this are two rows of input fields: 'Domain Name Server (DNS) Address' and 'Secondary DNS Address (optional)'. Each row has four input fields, each with a '0' entered. At the bottom right are three buttons: 'HELP', 'SAVE SETTINGS', and 'CANCEL'.

Domain Name Server (DNS) Address	0 . 0 . 0 . 0
Secondary DNS Address (optional)	0 . 0 . 0 . 0

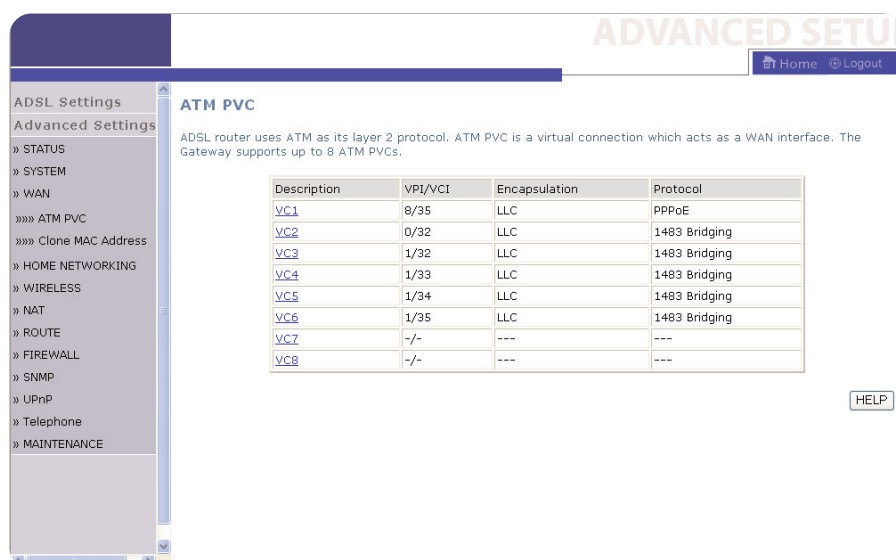

Domain Name Servers are used to map a domain name (e.g., www.somesite.com) to the equivalent numerical IP address (e.g., 64.147.25.20). Your ISP should provide the IP address of one or more Domain Name Servers. Enter those addresses on this page.

Specify the WAN connection parameters provided by your Internet Service Provider (ISP). The ADSL Modem Multiservices PSTN Voice can be connected to your ISP in one of the following ways:

- ATM PVC
- Clone MAC

ATM PVC

The ADSL Modem Multiservices PSTN Voice uses ATM as its WAN interface. Click on each ATM VC for WAN configuration.

See the table below for a description of the parameters.

Parameter	Description
Description	Click on the VC to set the values for the connection.
VPI/VCI	Virtual Path Identifier (VPI) and Virtual Circuit Identifier (VCI).
Encapsulation	Specifies how to handle multiple protocols at the ATM transport layer.
VC-MUX	Point-to-Point Protocol over ATM Virtual
Circuit	Multiplexer (null encapsulation) allows only one protocol running per virtual circuit with less overhead.
LLC	Point-to-Point Protocol over ATM Logical Link Control (LLC) allows multiple protocols running over one virtual circuit (using slightly more overhead).
Protocol	Protocol used for the connection.

ATM Interface

Clicking on the ATM VC brings up the following screen. The ADSL Modem Multiservices PSTN Voice uses ATM as its WAN interface. Protocols including 1483 Routing, 1483 Bridging, MAC Encapsulated Routing (MER), PPPoA and PPPoE with LLC-SNAP and VC-Mux encapsulations are supported for each ATM PVC.

When you have finished entering your connection parameters, click 'SAVE SETTINGS.' You can verify that you have established an ADSL connection by clicking Status at the bottom of the left-hand menu. See 'Status' on page 23. See the table below for a description of the parameters.

Parameter	Description
Protocol	
Disable	Disables the connection.
1483 Bridging	Bridging is a standardized layer 2 technology. It is typically used in corporate networks to extend the physical reach of a single LAN segment and increase the number of stations on a LAN without compromising performance. Bridged data is encapsulated using the RFC1483 protocol to enable data transport.
PPPoA	Point-to-Point Protocol over ATM is a method of encapsulating data for transmission to a far point.
1483 Routing	1483 Routing allows a simple, low-cost connection to the Internet via a standard Ethernet port. The router looks up the network address for each packet seen on the LAN port. If the address is listed in the routing table as local, it is filtered. If the address is listed under the ADSL port, it is forwarded. Or if the address is not found, then it is automatically forwarded to the default router (i.e., the ADSL Modem Multiservices PSTN Voice at the head end).
PPPoE	Point-to-Point over Ethernet is a common connection method used for xDSL.
MAC Encapsulated Routing	If your ADSL service is a Bridged mode service and you want to share the connection to multiple PC's, please select MAC Encapsulated Routing. MER is a protocol that allows you do IP routing with NAT enabled.
VPI/VCI	See Virtual Path Identifier (VPI) and Virtual Circuit Identifier (VCI). Data flows are broken up into fixed length cells, each of which contains a Virtual Path Identifier (VPI) that identifies the path between two nodes, and a Virtual Circuit Identifier (VCI) that identifies the data channel within that virtual path. Each virtual circuit maintains a constant flow of cells between the two end points. When there is no data to transmit, empty cells are sent. When data needs to be transmitted, it is immediately inserted into the cell flows.

Parameter	Description
Encapsulation	Shows the packet encapsulation type. Packet encapsulation specifies how to handle multiple protocols at the ATM transport layer.
VC-MUX	Point-to-Point Protocol over ATM Virtual Circuit Multiplexer (null encapsulation) allows only one protocol running per virtual circuit with less overhead.
LLC	Point-to-Point Protocol over ATM Logical Link Control allows multiple protocols running over one virtual circuit (using slightly more overhead).

Parameter	Description
Encapsulation	Shows the packet encapsulation type. Packet encapsulation specifies how to handle multiple protocols at the ATM transport layer.
VC-MUX	Point-to-Point Protocol over ATM Virtual Circuit Multiplexer (null encapsulation) allows only one protocol running per virtual circuit with less overhead.
LLC	Point-to-Point Protocol over ATM Logical Link Control allows multiple protocols running over one virtual circuit (using slightly more overhead).
QoS Class ATM	QoS classes including CBR, UBR and VBR.
PCR/SCR/MBS	QoS Parameters - PCR (Peak Cell Rate), SCR (Sustainable Cell Rate) and MBS (Maximum Burst Size) are configurable.
IP assigned by ISP	Select Yes if the IP address was provided by your ISP.
IP Address	If your IP address is assigned by the ISP each time you connect, leave this field all zeros. Otherwise, enter your ISP supplied static IP address here.
Subnet Mask	If your subnet mask is assigned by the ISP each time you connect, leave this field all zeros. Otherwise, enter your subnet mask here.
Connect Type	Sets connection mode to always connected, automatic or manual connection.
Idle Time (minutes)	Enter the maximum idle time for the Internet connection. After this time has been exceeded the connection will be terminated.
Username	Enter user name.
Password	Enter password.
Confirm Password	Confirm password.
MTU	Leave the Maximum Transmission Unit (MTU) at the default value (1500) unless you have a particular reason to change it.

Clone MAC Address

Clicking on the Clone MAC Address brings up the following screen.

Clone MAC Address

Some ISPs require you to register your MAC address with them. If you have done this, the MAC address of the Gateway must be changed to the MAC address that you supplied to your ISP.

■ WAN Interface MAC Address:

☒ Use the Gateway's default MAC address 00:12:BF:00:E2:3D

☐ Use this PC's MAC address 00:00:E2:92:FB:F0

☐ Enter a new MAC address manually:

00 : 00 : E2 : 92 : FB : F0

HELP SAVE SETTINGS CANCEL

Some ISPs may require that you register your MAC address with them. If this is the case, the MAC address of the ADSL Modem Multiservices PSTN Voice must be changed manually to the MAC address that you have registered with your ISP.

LAN

Use the LAN menu to configure the LAN IP address and to enable the DHCP server for dynamic client address allocation.

ADVANCED SETUP

Home Networking

You can enable DHCP to dynamically allocate IP addresses to your client PCs, or configure filtering functions based on specific clients or protocols. The router must have an IP address for the local network.

LAN IP

IP Address: 192.168.1.1

IP Subnet Mask: 255.255.255.0

DHCP Server: ☒ Enabled ☐ Disabled

VLAN Binding

LAN1: Default

LAN2: Default

LAN3: Default

LAN4: IDTV

DHCP Server

DHCP Server ID:

Lease Time: Two Days

IP Address Pool

Start IP: 192.168.1.2

End IP: 192.168.1.254

Domain Name:

HELP SAVE SETTINGS Cancel

Parameter	Description
-----------	-------------

LAN IP

IP Address	The IP address of the ADSL Modem Multiservices PSTN Voice.
IP Subnet Mask	The subnet mask of the ADSL Modem Multiservices PSTN Voice.
DHCP Server	To dynamically assign an IP address to client PCs, enable the
DHCP (Dynamic Host Configuration Protocol) Server	Lease Time Set the DHCP lease time.

Parameter	Description
-----------	-------------

LAN IP

IP Address	The IP address of the ADSL Modem Multiservices PSTN Voice.
IP Subnet Mask	The subnet mask of the ADSL Modem Multiservices PSTN Voice.
DHCP Server	To dynamically assign an IP address to client PCs, enable the
DHCP (Dynamic Host Configuration Protocol) Server	Lease Time Set the DHCP lease time.

IP Address Pool Start IP

End IP Domain Name

Specify the start IP address of the DHCP pool. Do not include the gateway address of the ADSL Modem Multiservices PSTN Voice in the client address pool. (See 'TCP/IP Configuration' on page 11). If you attempt to include the ADSL Modem Multiservices PSTN Voice gateway address (192.168.2.1 by default) in the DHCP pool, an error dialog box will appear. If you change the pool range, make sure the first three octets match the gateway's IP address, i.e., 192.168.2.xxx.

Specify the end IP address of the DHCP pool.

If your network uses a domain name, enter it here. Otherwise, leave this field blank. Remember to configure your client PCs for dynamic address allocation. (See 'TCP/IP Configuration' on page 11 for details.)

Wireless

The ADSL Modem Multiservices PSTN Voice also operates as a wireless access point, allowing wireless computers to communicate with each other. To configure this function, you need to enable the wireless function, define the radio channel, the domain identifier, and the security options.

Wireless Settings

Check Enable and click 'SAVE SETTINGS.'

The screenshot shows the 'ADVANCED SETUP' interface. On the left is a sidebar with 'ADSL Settings' expanded, showing a list of settings: STATUS, SYSTEM, WAN, HOME NETWORKING, WIRELESS, Channel and SSID, Access Control, Security, WEP, WPA, 802.1X, NAT, ROUTE, FIREWALL, SNMP, UPnP, Telephone, and MAINTENANCE. The 'WIRELESS' setting is selected. The main content area is titled 'Wireless Settings'. It contains a description: 'The gateway can be quickly configured as an wireless access point for roaming clients by setting the service set identifier (SSID) and channel number. It also supports data encryption and client filtering.' Below this is a section 'Enable or disable Wireless module function:' with two radio buttons: 'Enable' (selected) and 'Disable'. At the bottom right is a 'SAVE SETTINGS' button.

Channel and SSID

You must specify an Service Set ID (SSID) and a common radio channel to be used by the ADSL Modem Multiservices PSTN Voice and all of its wireless clients. Be sure you configure all of its clients to the same values. The SSID is case-sensitive and can consist of up to 32 alphanumeric characters. Functioning as an access point, the Gateway can be configured for roaming clients by setting the SSID and wireless channel.

The screenshot shows the 'ADVANCED SETUP' interface. On the left is a sidebar with 'ADSL Settings' expanded, showing a list of settings: STATUS, SYSTEM, WAN, HOME NETWORKING, WIRELESS, Channel and SSID, Access Control, Security, WEP, WPA, 802.1X, NAT, ROUTE, FIREWALL, SNMP, UPnP, Telephone, and MAINTENANCE. The 'Channel and SSID' setting is selected. The main content area is titled 'Channel and SSID'. It contains a description: 'This page allows you to define SSID and Channel ID for wireless connection. In the wireless environment, the router can also act as an wireless access point. These parameters are used for the mobile stations to connect to this access point.' Below this is a table with four rows: 'SSID' with a text input field containing 'WIFI_3E'; 'SSID Broadcast' with two radio buttons: 'ENABLE' (selected) and 'DISABLE'; 'Wireless Mode' with a dropdown menu showing 'Mixed (11b+11g)'; and 'Channel' with a dropdown menu showing '10'. At the bottom right are three buttons: 'HELP', 'SAVE SETTINGS', and 'CANCEL'.

See the description of the parameters below.

Parameter	Description
SSID	Service Set ID. The SSID must be the same on the ADSL Modem Multiservices PSTN Voice and all of its wireless clients. Note: <i>The SSID is case sensitive and can consist of up to 32 alphanumeric characters. (Default: WLAN)</i>
SSID Broadcast	Enable or disable the broadcasting of the SSID. Enable SSID broadcasting on the wireless network for easy connection with client PCs. For security reasons, you should disable SSID broadcast. (Default: Enable)
Wireless Mode	This device supports both 11g and 11b wireless networks. Make your selection depending on the type of wireless network that you have.
Channel	The radio channel used by the wireless router and its clients to communicate with each other. This channel must be the same on the ADSL Modem Multiservices PSTN Voice and all of its wireless clients. The ADSL Modem Multiservices PSTN Voice will automatically assign itself a radio channel, or you may select one manually. <i>Note: If you experience poor performance, you may be encountering interference from another wireless device. Try changing the channel, as this may eliminate interference and increase performance. Channels 1, 6, and 11, as the three non-overlapping channels in the 2.4GHz range, are preferred.</i> The available channel settings are limited by local regulations. (Default: Auto; Range: 1-11)

Access Control

Using the Access Control functionality, you can specify which PCs can wirelessly connect to the access point. Each PC has a unique identifier known as a Medium Access Control (MAC) address. With MAC filtering enabled, only the computers whose MAC address you have listed in the filtering table may connect to the ADSL Modem Multiservices PSTN Voice.

WLAN MAC Filtering Table

For a more secure Wireless network you can specify that only certain Wireless PCs can connect to the Access Point. Up to 32 MAC addresses can be added to the MAC Filtering Table. When enabled, all registered MAC addresses are controlled by the Access Rule.

- Enable MAC Filtering : ☐ Yes ☒ No
- Access Rule for registered MAC address : ☐ Allow ☒ Deny
- MAC Filtering Table (up to 32 stations)

ID	MAC Address
1	00 : 00 : 00 : 00 : 00 : 00
2	00 : 00 : 00 : 00 : 00 : 00
3	00 : 00 : 00 : 00 : 00 : 00

MAC Filtering Table (up to 32 stations)	Lists allowed MAC addresses.

Security

It is important to be aware of security issues, especially when using wireless. You can configure your security settings on this page.

If you are transmitting sensitive data across radio channels, you should enable wireless security.

For a more secure network, the ADSL Modem Multiservices PSTN Voice can implement one or a combination of the following security mechanisms:

- No WEP, No WPA*
- WEP Only
- WPA Only

*) Selecting the No WEP, No WPA option will bring you directly to the 802.1x configuration page.

The security mechanisms that may be employed depend on the level of security required, the network and management resources available, and the software support provided on wireless clients. A summary of wireless security considerations is listed in the following table.

Security	Client Support	Implementation Considerations
WEP	Built-in support on all 802.11b and 802.11g devices	<ul style="list-style-type: none"> • Only provides weak security. • Requires manual key management.
WPA	Requires WPA-enabled system and network card driver (native support provided in Windows XP)	<ul style="list-style-type: none"> • Provides good security in small networks. • Requires configured RADIUS server, or manual management of pre-shared key.
802.1X	Requires WPA-enabled system and network card driver (native support provided in Windows XP)	<ul style="list-style-type: none"> • Provides robust security in WPA-only mode (i.e., WPA clients only). • Requires configured RADIUS server. • 802.1x Extensible Authentication Protocol (EAP) type may require management of digital certificates for clients and server.

WEP

Wired Equivalent Privacy (WEP) encryption requires you to use the same set of encryption/decryption keys for the router and all of your wireless clients.

ADVANCED SETUP Home Logout

WEP

WEP is the basic mechanism to transmit your data securely over the wireless network. Matching encryption keys must be setup on your router and wireless client devices to use WEP.

WEP Mode: ☒ 64-bit ☐ 128-bit

Key Entry Method: ☒ Hex ☐ ASCII

Key Provisioning: ☒ Static ☐ Dynamic

Static WEP Key Setting

10/26 hex digits for 64-WEP/128-WEP

Default Key ID:

Passphrase: ☐ (1~32 characters)

Key 1:

Key 2:

Key 3:

Key 4:

See the description of the Access Control features below.

Parameter	Description
WEP	
WEP Mode	You can choose disabled, 64-bit or 128-bit encryption.
Key Entry Method	When MAC filtering is enabled, all registered MAC addresses are controlled by the Access Rule.
Key Provisioning	Select static key or dynamic key.
Static WEP Key Setting	You may manually enter the keys or automatically generate encryption keys. To manually configure the keys, enter 10 digits for each 64-bit key, or enter 26 digits for the single 128-bit key. (A hexadecimal digit is a number or letter in the range 0-9 or A-F.)
Default Key ID	Select the default key.
Passphrase	For automatic key generation, check the Passphrase box, enter a passphrase and click 'SAVE SETTINGS.'
Key 1-4	If you do not choose to use the Passphrase for automatic key generation, you must manually enter four keys. For 64-bit encryption, enter exactly 10 digits. For 128-bit encryption, enter exactly 26 digits. (A hexadecimal digit is a number or letter in the range 0-9 or A-F.)

Click 'SAVE SETTINGS' to apply your settings.

WPA

Wi-Fi Protected Access (WPA) combines Temporal Key Integrity Protocol (TKIP) and 802.1x mechanisms. It provides dynamic key encryption and 802.1x authentication service. With TKIP, WPA uses 48-bit initialization vectors, calculates an 8-byte message integrity code, and generates an encryption key periodically. For authentication, it allows you to use 802.1x authentication for an environment with a RADIUS server installed on your network. Selecting the Pre-shared Key enables WPA to use the pre-shared key in a SOHO network.

See the description of the WPA settings below.

Field Default	Parameter	Description
Cypher suite TKIP		One of the security mechanisms used by WPA for frame body and CRC frame encryption.
Authentication 802.1X	802.1x	It is for an enterprise network with a RADIUS server installed.
	Pre-shared Key	It is for a SOHO network without any authentication server installed.
Pre-shared key	Passphrase (8~63 characters)	Select the key type: type
	Passphrase	Input 8~63 characters.
	Hex	Input 64 hexadecimal digits. (A hexadecimal digit is a number or letter in the range 0-9 or A-F.)
Pre-shared Key characters.	None	Specify in passphrase style or in 64-Hex characters.
Group Key	Disable	The period of renewing broadcast/multicast Re_Keyng keys.

802.1X

Management access will be checked against the authentication database stored on the router. If an authentication RADIUS server is used, you must specify the secret key of the Message-Authenticator attribute, i.e., Message Digest-5 (MD5), and the corresponding parameters in the RADIUS Server Parameters field for the remote authentication protocol.

See the description of the 802.1x features below.

Field Default Parameter	Description
Server IP is set to 192.168.2.1	The IP address of the RADIUS server.
Server Port is set to 1812	UDP port used for RADIUS authentication messages
Re-Authentication is defined in 3600 seconds period	Defines a maximum period of time for which the period seconds RADIUS server will dynamically re-assign a session key to a connected client station
60 second Quit Period	Defines a maximum period of time for which the connection is maintained during inactivity.
Seesion idle is set to 300 seconds before timeout	Defines a maximum period of time for which the router will wait between failed authentications.
Server Type RADIUS using 802.1x security control.	Selects the authentication server type.
Secret Key set to None	Secret Key None Defines a text string on both the RADIUS client and server to secure RADIUS traffic.The RADIUS server requires the MD5 Message-Authenticator attribute for all access request messages. The 802.1x authentication scheme is supported by using the Extensible Authentication Protocol (EAP) over the RADIUS server.
NAS-ID is set to None	This defines the request identifier of the Network Access Server (NAS) or RADIUS client that is requesting client authentication from the RADIUS server.

NAT

From this section you can configure the Virtual Server, and Special Application features that provide control over the TCP/ UDP port openings in the router's firewall. This section can be used to support several Internet based applications such as web, email, FTP, and Telnet.

NAT Settings

The screenshot shows the 'ADVANCED SETUP' section of the router's web interface. On the left is a navigation menu with 'ADSL Settings' and 'Advanced Settings'. Under 'Advanced Settings', 'NAT' is selected, and its sub-menu 'Address Mapping' is highlighted. The main content area is titled 'NAT Settings'. It contains a description of NAT, a toggle for 'Enable or disable NAT module function' (set to 'Enable'), and a 'SAVE SETTINGS' button.

NAT allows one or more public IP addresses to be shared by multiple internal users. Enter the Public IP address you wish to share into the Global IP field. Enter a range of internal IPs that will share the global IP.

Address Mapping

The screenshot shows the 'Address Mapping' page in the router's web interface. The left navigation menu is the same as in the previous screenshot, with 'Address Mapping' selected. The main content area is titled 'Address Mapping' and contains a description of the feature. Below the description is a table with 10 rows, each for a mapping entry. Each row has fields for 'Global IP' (a dropdown menu), a description 'is transformed as multiple virtual IPs', and a range of internal IPs 'from 192.168.1.0 to 192.168.1.0'. At the bottom right are 'HELP', 'SAVE SETTINGS', and 'CANCEL' buttons.

Use Address Mapping to allow a limited number of public IP addresses to be translated into multiple private IP addresses for use on the internal LAN network. This also hides the internal network for increased privacy and security.

Special Applications

Some applications require multiple connections, such as Internet gaming, video conferencing, Internet telephony and others. These applications cannot work when Network Address Translation (NAT) is enabled. If you need to run applications that require multiple connections, specify the port normally associated with an application in the "Trigger Port" field, select the protocol type as TCP or UDP, then enter the public ports associated with the trigger port to open them for inbound traffic.

Note: The range of the Trigger Ports is from 1 to 65535.

	Trigger Port	Trigger Type	Public Port	Public Type	Enabled
1.	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
2.	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
3.	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
4.	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
5.	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
6.	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
7.	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
8.	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
9.	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
10.	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="text"/>	<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>

Popular applications: -- select one --

Using this feature, you can put PCs with public IPs and PCs with private IPs in the same LAN area.

If you configure the ADSL Modem Multiservices PSTN Voice as a virtual server, remote users accessing services such as web or FTP at your local site via public IP addresses can be automatically redirected to local servers configured with private IP addresses. In other words, depending on the requested service (TCP/UDP port number), the ADSL Modem Multiservices PSTN Voice redirects the external service request to the appropriate server (located at another internal IP address).

For example, if you set Type/Public Port to TCP/80 (HTTP or web) and the Private IP/Port to 192.168.2.2/80, then all HTTP requests from outside users will be transferred to 192.168.2.2 on port 80. Therefore, by just entering the IP address provided by the ISP, Internet users can access the service they need at the local address to which you redirect them.

The more common TCP service ports include:
HTTP: 80, FTP: 21, Telnet: 23, and POP3: 110.

Special Applications

Some applications, such as Internet gaming, videoconferencing, Internet telephony and others, require multiple connections. These applications cannot work with Network Address Translation (NAT) enabled. If you need to run applications that require multiple connections, use the following screen to specify the additional public ports to be opened for each application.

Special Applications

Some applications require multiple connections, such as Internet gaming, video conferencing, Internet telephony and others. These applications cannot work when Network Address Translation (NAT) is enabled. If you need to run applications that require multiple connections, specify the port normally associated with an application in the "Trigger Port" field, select the protocol type as TCP or UDP, then enter the public ports associated with the trigger port to open them for inbound traffic.

Note: The range of the Trigger Ports is from 1 to 65535.

	Trigger Port	Trigger Type	Public Port	Public Type	Enabled
1.		<input checked="" type="radio"/> TCP <input type="radio"/> UDP		<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
2.		<input checked="" type="radio"/> TCP <input type="radio"/> UDP		<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
3.		<input checked="" type="radio"/> TCP <input type="radio"/> UDP		<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
4.		<input checked="" type="radio"/> TCP <input type="radio"/> UDP		<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
5.		<input checked="" type="radio"/> TCP <input type="radio"/> UDP		<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
6.		<input checked="" type="radio"/> TCP <input type="radio"/> UDP		<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
7.		<input checked="" type="radio"/> TCP <input type="radio"/> UDP		<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
8.		<input checked="" type="radio"/> TCP <input type="radio"/> UDP		<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
9.		<input checked="" type="radio"/> TCP <input type="radio"/> UDP		<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>
10.		<input checked="" type="radio"/> TCP <input type="radio"/> UDP		<input checked="" type="radio"/> TCP <input type="radio"/> UDP	<input type="checkbox"/>

Popular applications:

Specify the public port number normally associated with an application in the Trigger Port field. Set the protocol type to TCP or UDP, then enter the ports that the application requires. The ports may be in the format 7, 11, 57, or in a range, e.g., 72-96, or a combination of both, e.g., 7, 11, 57, 72-96.

Popular applications requiring multiple ports are listed in the Popular Applications field.

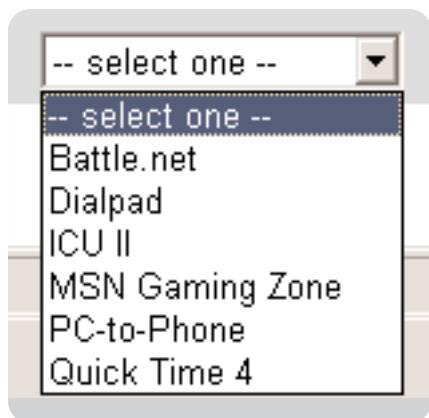

From the drop-down list, choose the application and then choose a row number to copy this data into.

Note: Choosing a row that already contains data will overwrite the current settings.

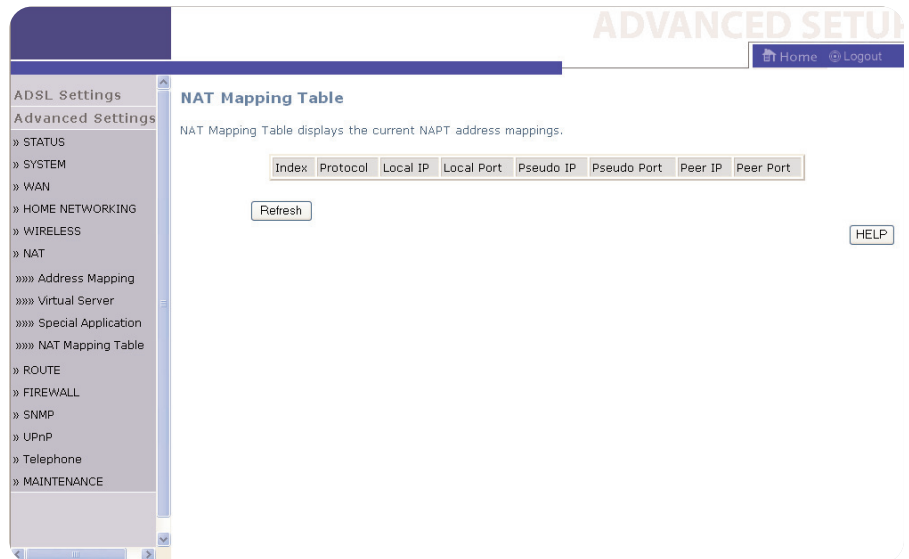

Example:

ID	Trigger Type	Port Public	Trigger Port	Public Type	Comment
1	6112	UDP	6112	UDP	Battle.net
2	28800	TCP	2300-2400, 47624	TCP	MSN Game Zone

For a full list of ports and the services that run on them, see www.iana.org/assignments/port-numbers.

NAT Mapping Table

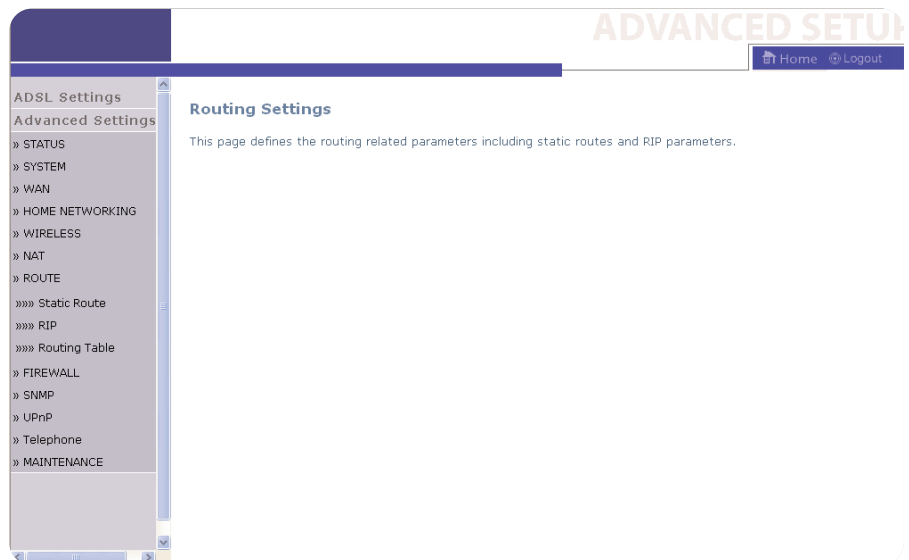

NAT Mapping Table displays the current NAPT address mappings. The NAT address mappings are listed 20 lines per page, click the control buttons to move forwards and backwards. As the NAT mapping is dynamic, a Refresh button is provided to refresh the NAT Mapping Table with the most up-to-date values.

The content of the NAT Mapping Table is described as follows:

- Protocol - protocol of the flow.
- Local IP - local (LAN) host's IP address for the flow.
- Local Port - local (LAN) host's port number for the flow.
- Pseudo IP - translated IP address for the flow.
- Pseudo Port - translated port number for the flow.
- Peer IP - remote (WAN) host's IP address for the flow.
- Peer Port - remote (WAN) host's port number for the flow.

Route

These pages define routing related parameters, including static routes and Routing Information Protocol (RIP) parameters.

Static Route Parameters

Static Route Parameter

Please Enter the Following Configuration Parameters:

Index	Network Address	Subnet Mask	Gateway	Configure
1	192.168.3.0	255.255.255.0	192.168.1.5	Edit Delete

[Add](#)

[HELP](#) [SAVE SETTINGS](#) [Cancel](#)

Parameter	Description
Index	Displays the number of the route.
Network Address	Enter the IP address of the remote computer for which to set a static route.
Subnet Mask	Enter the subnet mask of the remote network for which to set a static route.
Gateway	Enter the WAN IP address of the gateway to the remote network.
Configure	Allows you to modify or delete configuration settings.

Click Add to display the following page and add a new static route to the list.

Static Route Parameter

Please Enter the Following Configuration Parameters:

Index	Network Address	Subnet Mask	Gateway	Configure
1	192.168.3.0	255.255.255.0	192.168.1.5	Edit Delete

[Add](#)

[HELP](#) [SAVE SETTINGS](#) [Cancel](#)

Parameter	Description
Index	Displays the number of the route.
Network Address	Enter the IP address of the remote computer for which to set a static route.
Subnet Mask	Enter the subnet mask of the remote network for which to set a static route.
Gateway	Enter the WAN IP address of the gateway to the remote network.
Configure	Allows you to modify or delete configuration settings.

RIP Parameter

The device supports RIP v1 and v2 to dynamically exchange routing information with adjacent routers.

Parameter Description

General RIP Parameters

RIP mode	Globally enables or disables RIP.
Auto summary	If Auto summary is disabled, then RIP packets will include sub-network information from all sub-networks connected to the ADSL Router. If enabled, this sub-network information will be summarized to one piece of information covering all sub-networks.

Table of current Interface RIP parameter

Interface	The WAN interface to be configured.
Operation Mode	Disable: RIP disabled on this interface. Enable: RIP enabled on this interface. Silent: Listens for route broadcasts and updates its route table. It does not participate in sending route broadcasts.
Version	Sets the RIP version to use on this interface.
Poison Reverse	A method for preventing loops that would cause endless retransmission of data traffic.

Authentication Required

- None: No authentication.
- Password: A password authentication key is included in the packet. If this does not match what is expected, the packet will be discarded. This method provides very little security as it is possible to learn the authentication key by watching RIP packets.
- MD5: An algorithm that is used to verify data integrity through the creation of a 128-bit message digest from data input (which may be a message of any length) that is claimed to be as unique to that specific data as a fingerprint is to a specific individual.

Authentication Code Password or MD5 Authentication key.

RIP sends routing-update messages at regular intervals and when the network topology changes. When a router receives a routing update that includes changes to an entry, it updates its routing table to reflect the new route. RIP routers maintain only the best route to a destination. After updating its routing table, the router immediately begins transmitting routing updates to inform other network routers of the change.

Routing Table

Routing Table

List Routing Table:

Flags	Network Address	Netmask	Gateway	Interface	Metric
C	192.168.1.0	255.255.255.0	directly	VLAN1	---
C	192.168.2.0	255.255.255.0	directly	VLAN2	---
C	127.0.0.1	255.255.255.255	directly	Loopback	---

Flags : C - directly connected, S - static, R - RIP, I - ICMP Redirect

[HELP](#)

Parameter	Description
Flags	Indicates the route status:
C	Direct connection on the same subnet.
S	Static route.
R	RIP (Routing Information Protocol) assigned route.
I	ICMP (Internet Control Message Protocol) Redirect route.

Network Destination IP address.

Netmask

The subnetwork associated with the destination.

This is a template that identifies the address bits in the destination address used for routing to specific subnets. Each bit that corresponds to a '1' is part of the subnet mask number; each bit that corresponds to '0' is part of the host number.

Gateway

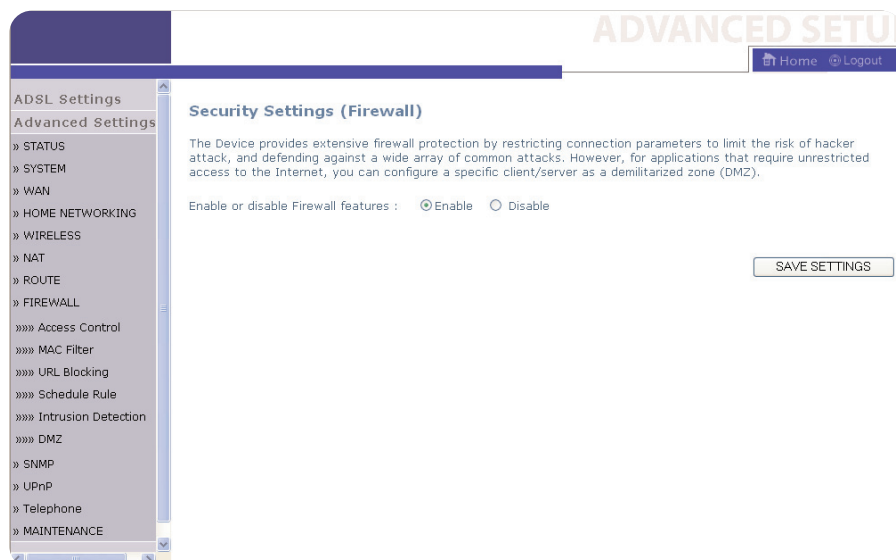

The IP address of the router at the next hop to which frames are forwarded.

Interface

The local interface through which the next hop of this route is reached.

Metric

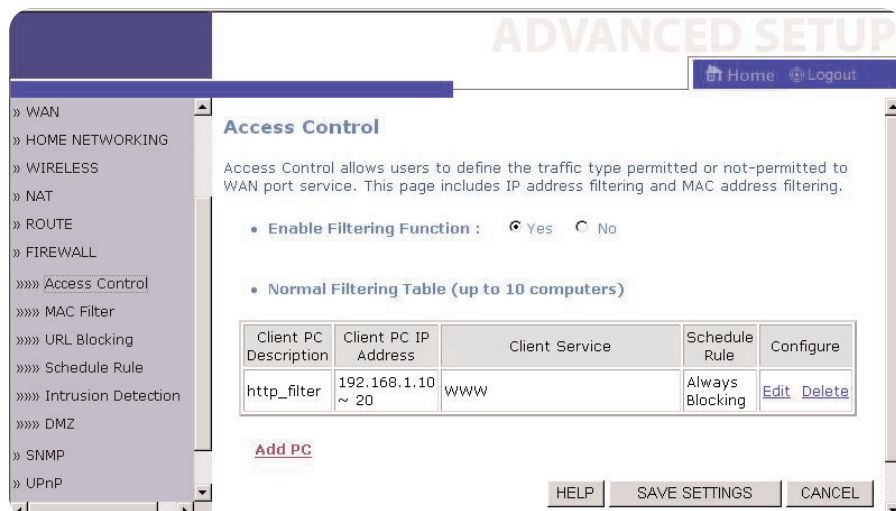

When a router receives a routing update that contains a new or changed destination network entry, the router adds 1 to the metric value indicated in the update and enters the network in the routing table.

The ADSL Modem Multiservices PSTN Voice's firewall enables access control of client PCs, blocks common hacker attacks, including IP Spoofing, Land Attack, Ping of Death, IP with zero length, Smurf Attack, UDP port loopback, Snork Attack, TCP null scan, and TCP SYN flooding. The firewall does not significantly affect system performance and we advise leaving it enabled to protect your network.

Note: After you check the radio button in the 'Enable or disable Firewall features' field, you must click the 'SAVE SETTINGS' button to display the list of firewall features.

Access Control

Access Control allows users to define the outgoing traffic permitted or not-permitted through the WAN interface. In the example above, all incoming and outgoing emails are blocked. The default is to permit all outgoing traffic. (See the following page for details.)

The ADSL Modem Multiservices PSTN Voice can also limit the access of hosts within the local area network (LAN). The MAC Filtering Table allows the ADSL Modem Multiservices PSTN Voice to enter up to 32 MAC addresses that are not allowed access to the WAN port.

The following items are displayed on the Access Control screen:

Parameter	Description
Enable Filtering	Enables or disables the filtering function. Function
Normal Filtering Table	Displays the IP address (or an IP address range) filtering table.

Click Add PC on the Access Control screen to view the following page.

Access Control Add PC

The settings in the screen shot below will block all email sending and receiving.

Access Control Add PC

This page allows users to define service limitations of client PCs, including IP address, service type and scheduling rule criteria. For the URL blocking function, you need to configure the URL address first on the "URL Blocking Site" page. For the scheduling function, you also need to configure the schedule rule first on the "Schedule Rule" page.

- Client PC Description:
- Client PC IP Address: 192.168.2. ~
- Client PC Service:

Service Name	Detail Description	Blocking
WWW	HTTP, TCP Port 80, 3128, 8000, 8001, 8080	<input type="checkbox"/>
WWW with URL Blocking	HTTP (Ref. URL Blocking Site Page)	<input type="checkbox"/>
E-mail Sending	SMTP, TCP Port 25	<input type="checkbox"/>
News Forums	NNTP, TCP Port 119	<input type="checkbox"/>
E-mail Receiving	POP3, TCP Port 110	<input type="checkbox"/>
Secure HTTP	HTTPS, TCP Port 443	<input type="checkbox"/>
File Transfer	FTP, TCP Port 21	<input type="checkbox"/>
Telnet Service	TCP Port 23	<input type="checkbox"/>
AIM	AOL Instant Messenger, TCP Port 5190	<input type="checkbox"/>
NetMeeting	H.323, TCP Port 1720, 1503	<input type="checkbox"/>
DNS	UDP Port 53	<input type="checkbox"/>
SNMP	UDP Port 161, 162	<input type="checkbox"/>
VPN-PPTP	TCP Port 1723	<input type="checkbox"/>
VPN-L2TP	UDP Port 1701	<input type="checkbox"/>
TCP	All TCP Port	<input type="checkbox"/>
UDP	All UDP Port	<input type="checkbox"/>

Define the appropriate settings for client PC services (as shown above). Click 'OK' to save your settings. The added PC will now appear in the Access Control page.

MAC Filter

Use this page to block access to your network using MAC addresses.

MAC Filtering Table

This section helps provides MAC Filter configuration. When enabled, only MAC addresses configured will have access to your network. All other client devices will get denied access. This security feature can support up to 32 devices and applies to clients.

HELP SAVE SETTINGS CANCEL

The ADSL Modem Multiservices PSTN Voice can also limit the access of hosts within the local area network (LAN). The MAC Filtering Table allows the ADSL Modem Multiservices PSTN Voice to enter up to 32 MAC addresses that are allowed access to the WAN port. All other devices will be denied access.

URL Blocking

To configure the URL Blocking feature, use the table below to specify the web sites (www.somesite.com) and/or keywords you want to filter on your network. To complete this configuration, you will need to create or modify an access rule in 'Access Control' on page 45. To modify an existing rule, click the Edit option next to the rule you want to modify. To create a new rule, click on the Add PC option. From the Access Control, Add PC section, check the option for 'WWW with URL Blocking' in the Client PC Service table to filter out the web sites and keywords selected below, on a specific PC.

The ADSL Modem Multiservices PSTN Voice allows the user to block access to web sites from a particular PC by entering either a full URL address or just a keyword. This feature can be used to protect children from accessing violent or pornographic web sites.

ADVANCED SETUP Home Logout

OK Cancel

Define the appropriate settings for a schedule rule (as shown on the following screen). The rule in the screen shot above prohibits emailing after 3.00 pm from Monday to Thursday. Upon completion, click 'OK' to save your schedule rules.

Intrusion Detection

The ADSL Modem Multiservices PSTN Voice's firewall inspects packets at the application layer, maintains TCP and UDP session information including timeouts and number of active sessions, and provides the ability to detect and prevent certain types of network attacks such as Denial-of-Service (DoS) attacks.

Intrusion Detection

When the SPI (Stateful Packet Inspection) firewall feature is enabled, all packets can be blocked. Stateful Packet Inspection (SPI) allows full support of different application types that are using dynamic port numbers. For the applications checked in the list below, the Device will support full operation as initiated from the local LAN.

The Device firewall can block common hacker attacks, including IP Spoofing, Land Attack, Ping of Death, IP with zero length, Smurf Attack, UDP port loopback, Snork Attack, TCP null scan, and TCP SYN flooding.

• Intrusion Detection Feature

SPI and Anti-DoS firewall protection	<input checked="" type="checkbox"/>

TCP FIN wait: 5 sec.

TCP connection idle timeout: 3600 sec.

UDP session idle timeout: 30 sec.

H.323 data channel idle timeout: 180 sec.

• DoS Detect Criteria:

Total incomplete TCP/UDP sessions HIGH: 300 session

Total incomplete TCP/UDP sessions LOW: 250 session

Incomplete TCP/UDP sessions (per min) HIGH: 250 session

Incomplete TCP/UDP sessions (per min) LOW: 200 session

Maximum incomplete TCP/UDP sessions number from same host: 100

Incomplete TCP/UDP sessions detect sensitive time period: 900 msec.

Maximum half-open fragmentation packet number from same host: 30

Half-open fragmentation detect sensitive time period: 10000 msec.

Flooding cracker block time: 300 sec.

[HELP](#)

[SAVE SETTINGS](#)

[CANCEL](#)

Network attacks that deny access to a network device are called DoS attacks. DoS attacks are aimed at devices and networks with a connection to the Internet. Their goal is not to steal information, but to disable a device or network so users no longer have access to network resources.

The ADSL Modem Multiservices PSTN Voice protects against DoS attacks including: Ping of Death (Ping flood) attack, SYN flood attack, IP fragment attack (Teardrop Attack), Brute-force attack, Land Attack, IP Spoofing attack, IP with zero length, TCP null scan (Port Scan Attack), UDP port loopback, Snork Attack.

Note: The firewall does not significantly affect system performance, so we advise enabling the prevention features to protect your network.

Parameter	Defaults	Description
Enable SPI and Anti-DoS firewall protection	Yes	The Intrusion Detection feature of the Telephony Router limits the access of incoming traffic at the WAN port. When the Stateful Packet Inspection (SPI) feature is turned on, all incoming packets are blocked except those types marked with a check in the Stateful Packet Inspection section at the top of the screen.
Stateful Packet Inspection		<p>This option allows you to select different application types that are using dynamic port numbers. If you wish to use Stateful Packet Inspection (SPI) for blocking packets, click on the Yes radio button in the 'Enable SPI and Anti-DoS firewall protection' field and then check the inspection type that you need, such as Packet Fragmentation, TCP Connection, UDP Session, FTP Service, H.323 Service, and TFTP Service.</p> <p>It is called a 'stateful' packet inspection because it examines the contents of the packet to determine the state of the communication; i.e., it ensures that the stated destination computer has previously requested the current communication. This is a way of ensuring that all communications are initiated by the recipient computer and are taking place only with sources that are known and trusted from previous interactions. In addition to being more rigorous in their inspection of packets, stateful inspection firewalls also close off ports until a connection to the specific port is requested.</p> <p>When particular types of traffic are checked, only the particular type of traffic initiated from the internal LAN will be allowed. For example, if the user only checks FTP Service in the Stateful Packet Inspection section, all incoming traffic will be blocked except for FTP connections initiated from the local LAN.</p>
Hacker Prevention		
Discard Ping from WAN Discard	Disabled	Prevents a ping on the router's WAN port from being routed to the network.

Parameter	Defaults	Description
RIP Defect	Enabled	If the router does not reply to an IPX RIP request packet, it will stay in the input queue and not be released. Accumulated packets could cause the input queue to fill, causing severe problems for all protocols. Enabling this feature prevents the packets accumulating. When hackers attempt to enter your network, we can alert you by email
Your E-mail Address		Enter your email address.
SMTP Server Address		Enter your SMTP server address (usually the part of the email address following the '@' sign).
POP3 Server Address		Enter your POP3 server address (usually the part of the email address following the '@' sign).
User Name		Enter your email account user name.
Password		Enter your email account password.

Connection Policy

Fragmentation half-open	wait 10 secs	Configures the number of seconds that a packet state structure remains active. When the timeout value expires, the router drops the unassembled packet, freeing that structure for use by another packet.
TCP SYN	wait 30 secs	Defines how long the software will wait for a TCP session to reach an established state before dropping the session.
TCP FIN	wait 5 secs	Specifies how long a TCP session will be managed after the firewall detects a FIN-exchange.
TCP connection	3600 secs	The length of time for which a TCP session will be idle timeout (1 hour) managed if there is no activity.
UDP session	idle 30 secs	The length of time for which a UDP session will timeout be managed if there is no activity.
H.323 data timeout	180 secs	The length of time for which an H.323 session will channel idle be managed if there is no activity.

Parameter	Defaults	Description
DoS Detect Criteria		
Total incomplete	300	Defines the rate of new unestablished sessions that TCP/UDP sessions will cause the software to start deleting half-open sessions HIGH sessions.
Total incomplete	250	Defines the rate of new unestablished sessions that TCP/UDP sessions will cause the software to stop deleting half-open sessions LOW sessions.
Incomplete	250	Maximum number of allowed incomplete

Parameter	Defaults	Description
TCP/UDP sessions		
TCP/UDP sessions per minute.	HIGH	Incomplete 200 Minimum number of allowed incomplete
incomplete TCP/UDP	LOW	Maximum 10 Maximum number of incomplete sessions from the same host.
TCP/UDP sessions number from same host		
Incomplete sessions detect sensitive time period	300 msec	Length of time before an incomplete TCP/UDP session is detected as incomplete.
Maximum 30 fragmentation packet number from same host		Maximum number of half-open fragmentation half-open packets from the same host.
Half-open fragmentation detect sensitive time period	1 sec	Length of time before a half-open fragmentation session is detected as half-open.
Flooding cracker	300 sec	Length of time from detecting a flood attack to block time blocking the attack.

DMZ(Demilitarized Zone)

If you have a local client PC that cannot run an Internet application properly from behind the NAT firewall, then you can open the client up to unrestricted two-way Internet access by defining a Virtual DMZ Host.

Enable DMZ: ☐ Yes ☒ No

Multiple PCs can be exposed to the Internet for two-way communications e.g. Internet gaming, video conferencing, or VPN connections. To use the DMZ, you must set a static IP address for that PC.

	Public IP Address	Client PC IP Address
1.	0.0.0.0	192.168.1.0
2.	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	192.168.1.0
3.	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	192.168.1.0
4.	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	192.168.1.0
5.	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	192.168.1.0
6.	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	192.168.1.0

8.	<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	192.168.1.0

HELP

SAVE SETTINGS

CANCEL

If you have a client PC that cannot run an Internet application properly from behind the firewall, you can open the client up to unrestricted two-way Internet access. Enter the IP address of a DMZ (Demilitarized Zone) host on this screen. Adding a client to the DMZ may expose your local network to a variety of security risks, so only use this option as a last resort.

SNMP

Community

Use the SNMP configuration screen to display and modify parameters for the Simple Network Management Protocol (SNMP). A computer attached to the network, called a Network Management Station (NMS), can be used to access this information. Access rights to the agent are controlled by community strings. To communicate with the ADSL Modem Multiservices PSTN Voice, the NMS must first submit a valid community string for authentication.

Parameter	Description
Community	A community name authorized for management access.
Access	Management access is restricted to Read or Write.
Valid	Enables or disables the entry.

Note: Up to 5 community names may be entered.

SNMP Trap

In the context of SNMP, an unsolicited message can be sent by an agent to management station. The purpose is to notify the management station of some unusual event.

No.	IP Address	Community	Version
1	0 . 0 . 0 . 0 . 0		Disabled ▼
2	0 . 0 . 0 . 0 . 0		Disabled ▼
3	0 . 0 . 0 . 0 . 0		Disabled ▼
4	0 . 0 . 0 . 0 . 0		Disabled ▼
5	0 . 0 . 0 . 0 . 0		Disabled ▼

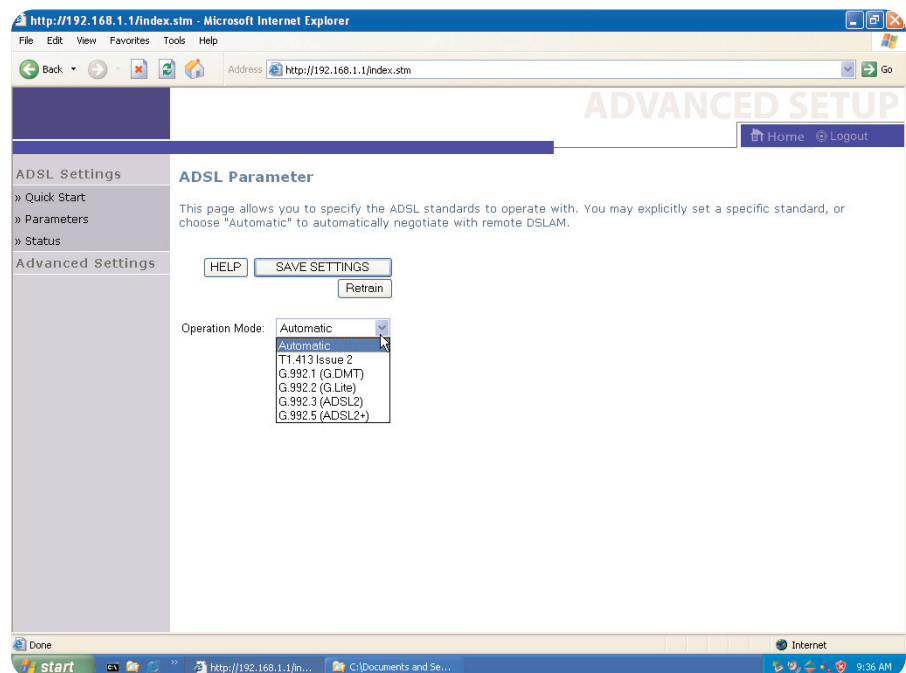

HELP SAVE SETTINGS CANCEL

Parameter	Description
IP Address	Community
Version	Traps are sent to this address when errors or specific events occur on the network.
	A community string (password) specified for trap management. Enter a word, something other than public or private, to prevent unauthorized individuals from reading information on your system.
	Sets the trap status to disabled, or enabled with V1 or V2c.
	The v2c protocol was proposed in late 1995 and includes enhancements to v1 that are universally accepted. These include a get-bulk command to reduce network management traffic when retrieving a sequence of MIB variables, and a more elaborate set of error codes for improved reporting to a Network Management Station.

ADSL

ADSL Parameters

We recommend leaving the Operation Mode at the default Automatic setting, to automatically negotiate with remote DSLAM.

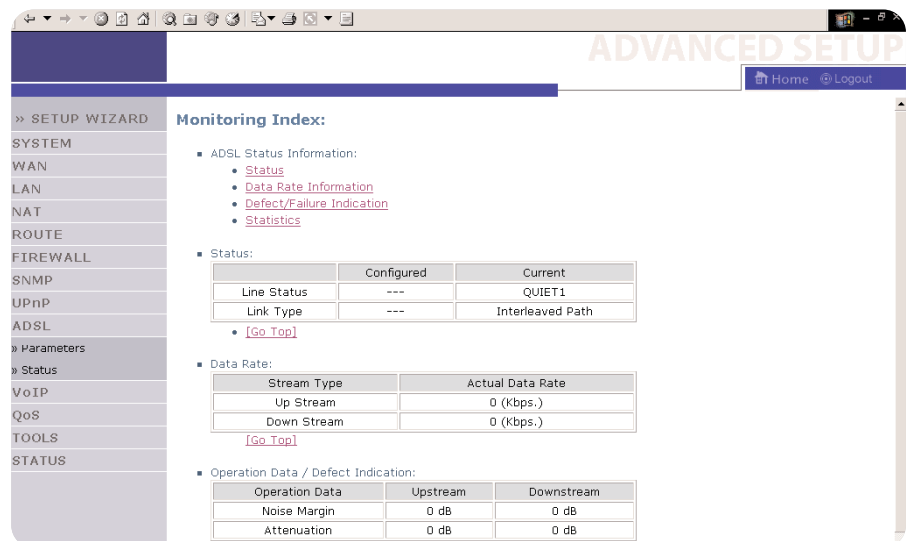

Operation Mode

- Automatic
- T1.413 Issue 2
- G.992.1 (G.DMT)
- G.992.2 (G.Lite)
- G.992.3 (ADSL2)
- G.992.5 (ADSL2+)

Status

The Status page displays ADSL status information.

Parameter	Description
Status	
• Line Status	Shows the current status of the ADSL line.
Data Rate	
• Upstream	Actual and maximum upstream data rate.
• Downstream	Actual and maximum downstream data rate.
Operation Data/Defect Indication	
• Noise Margin	
- Upstream	Minimum noise margin upstream.
- Downstream	Minimum noise margin downstream.
• Output Power	Maximum fluctuation in the output power.
• Attenuation	
- Upstream	Maximum reduction in the strength of the upstream signal.
- Downstream	Maximum reduction in the strength of the downstream signal.
• Fast Path FEC Correction	There are two latency paths that may be used: fast and interleaved. For either path a forward error correction (FEC) scheme is employed to ensure higher data integrity. For maximum noise immunity, an interleaver may be used to supplement FEC.
• Interleaved Path FEC Correction	An interleaver is basically a buffer used to introduce a delay, allowing for additional error correction techniques to handle noise. Interleaving slows the data flow and may not be optimal for real-time signals such as video transmission.
• Fast Path CRC Error	Indicates the number of Fast Path Cyclic Redundancy Check errors.
• Interleaved Path CRC Error	Indicates the number of Interleaved Path Cyclic Redundancy Check errors.
• Loss of Signal Defect	Momentary signal discontinuities.
• Loss of Frame Defect	Failures due to loss of frames.
• Loss of Power Defect	Failures due to loss of power.
• Fast Path HEC Error	Fast Path Header Error Concealment errors.
• Interleaved Path HEC Error	Interleaved Path Header Error Concealment errors.
Statistics	
	(Superframes represent the highest level of data presentation. Each superframe contains regular ADSL frames, one of which is used to provide superframe synchronization, identifying the start of a superframe. Some of the remaining frames are also used for special functions.)
• Received Superframes Interleaved	Number of interleaved superframes received.
• Transmitted Superframes Interleaved	Number of interleaved superframes transmitted.
• Received Superframes Fast	Number of fast superframes received.
• Transmitted Superframes Fast	Number of fast superframes transmitted.

Port Setting

Configure the port settings on this page, and click 'OK' to save the parameters. Telephony providers operate SIP proxies that allow you to register your ADSL Modem Multiservices PSTN Voice on their system so that you can call friends, family and business associates. There are many Telephony service providers available. It is up to you to decide which service provider is best for your needs.

Once you have decided on a provider, you will need to get the following information: Username, Password, SIP Domain, Realm, SIP Proxy IP, SIP Proxy Port.

SIP Setting

Configure the following SIP-related parameters. And press **SAVE SETTINGS** button.

SIP Parameters

SIP Listen Port	5060
Proxy Setting	Proxy IP: voip.belgacom.be
	Proxy Port: 5060
Registrar Setting	Registrar IP: voip.belgacom.be
	Registrar Port: 5060
Re-Registration Time Interval	3600

HELP SAVE SETTINGS CANCEL

SIP, the Session Initiation Protocol, is a signaling protocol for Internet conferencing, telephony, presence, events notification and instant messaging. The call waiting feature allows the user to take an incoming call, even though the user is already on the phone. The user upon hearing the new call, can put the original caller on hold and speak to the new caller. When the user hasn't finished talking to the new caller, he can resume his conversation with the original caller.

According to the SIP RFC, a proxy server is 'An intermediary entity that acts as both a server and a client for the purpose of making requests on behalf of other clients. A proxy server primarily plays the role of routing, which means its job is to ensure that request is sent to another entity 'closer' to the targeted user.'

The proxy server therefore, is an intermediate device that receives SIP requests from a client and then forwards the requests on the client's behalf. Proxy servers receive SIP messages and forward them to the next SIP server in the network. A series of proxy and redirect servers receive requests from a client and decide where to send these requests. Proxy servers can provide functions such as authentication, authorization, network access control, routing, reliable request retransmission, and security.

From the SIP RFC, 'A registrar is a server that accepts REGISTER requests and places the information it receives in those requests into the location service for the domain it handles.'

See the table below for a description of the parameters.

Parameter	Description
SIP Listen Port	It is strongly recommended that you to leave the SIP port unchanged (Default: 5060).
Support Call	Enables or disables support for call waiting. Waiting (Default: Disabled)
Proxy Setting	Set the proxy settings.
• Proxy IP	IP address of your proxy server. (From your Telephony provider.)
• Proxy Port	Port number of the proxy server. (From your Telephony provider.)
Registrar Setting	Set the registrar settings.
• Registrar IP	IP address of SIP registrar.
• Registrar Port	Port number of SIP registrar.

Telephony Advanced Setting

Configure the Telephony advanced settings on this page, and click 'OK.'

SIP is a peer-to-peer protocol. The peers in a session are called User Agents (UAs).

A user agent can function in one of the following roles:

1. User agent client (UAC) - A client application that initiates the SIP request.
2. User agent server (UAS) - A server application that contacts the user when a SIP request is received and that returns a response on behalf of the user.

Typically, an SIP end point is capable of functioning as both a UAC and a UAS, but functions only as one or the other per transaction.

Phone standards vary internationally, so it is important that the ADSL Modem Multiservices PSTN Voice is configured for the correct country.

Codecs are used to convert an analog voice signal to digitally encoded version. Codecs vary in the sound quality, the bandwidth required, the computational requirements, etc. You can specify which audio coding process you would like to use. There are four voice codecs supported by the ADSL Modem Multiservices PSTN Voice, you may try different settings to determine the best audio quality you obtain from the combination of your network connection and your used audio device (head set or hand set). The default codec sequence is listed below. You can use the Up and Down buttons to change priority.

1. G.711 A law
2. G.711 U law
3. G.729
4. G.723.3

See the table below for a description of the parameters.

Parameter	Description
Support Call	Enables or disables support for call waiting. Waiting (Default: Disabled)
Support User-Agent	Enables or disables user-agent header support. Enabling this Header feature includes user agent information in the packet, e.g., the caller's ID may be displayed. (Default: Disabled)
Telephony Hook	The hook flash timer is the length of time before the hook Flash Timer flash indicates a time-out (or call disconnect). (Default: 800 milliseconds.)
Telephony Tone	Select the country. Country Setting
Voice Codec	Set the voice codecs.
Configuration	
• Available Codecs	List of available codecs.
• Selected Codecs	List of selected codecs.

Dialing Plans

Configure the Telephony dialing plans on this page, and click 'SAVE SETTINGS.'

Telephone Status and Call Logs

Phone Number Status :

Phone Number	SIP URL	Registration
Common Number	sip:@voip.belgacom.be	-
Number 1	sip:@voip.belgacom.be	Fail
Number 2	sip:@voip.belgacom.be	Fail

Phone Port Call Logs :

Port Type	Received Call	Dialed Call	Missed Call	Rejected Call	Forwarded Call
Phone 1	0	0	0	0	0
Phone 2	0	0	0	0	0

Refresh

This page displays the Port Type, SIP URL and Registration status of the ADSL Modem Multiservices PSTN Voice.

See the table below for a description of the parameters.

Parameter	Description
Port Type	Displays the port type, i.e., FXS.
SIP URL	Shows the SIP URL.
Registration	Indicates whether the user has successfully registered or not.

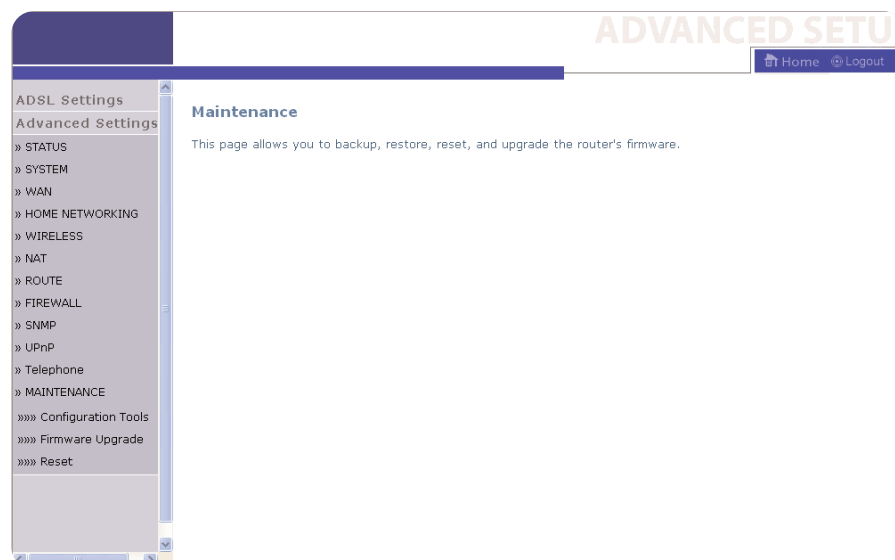

Telephony Call Logs

View the call log for both FXS ports on this page. Click 'Refresh' to update the page.

See the table below for a description of the parameters.

Parameter	Description
Parameter	Description
Port Type	Displays the port type, i.e., FXS.
Received Call	Number of received calls.
Dialed Call	Number of calls made.
Rejected Call	Number of rejected calls.
Forwarded Call	Number of forwarded calls.

Maintenance

Check Backup Router Configuration and click 'NEXT' to save your ADSL Modem Multiservices PSTN Voice's configuration to a file named 'backup.bin' on your PC. You can then check Restore from saved Configuration file (backup.bin) to restore the saved backup configuration file.

To restore the factory settings, check Restore router to Factory Defaults and click 'NEXT.' You will be asked to confirm your decision. Click 'APPLY' to proceed, or 'CANCEL' to go back.

Firmware Upgrade

Use this screen to update the firmware or user interface to the latest versions.

The screenshot shows the 'Firmware Upgrade' page within the 'ADVANCED SETUP' interface. On the left is a navigation menu with categories like ADSL Settings, Advanced Settings, and various system settings. The main content area has a title 'Firmware Upgrade' and a description: 'This tool allows you to upgrade the router firmware using a file provided by us. You can download the latest firmware from <http://selfcare.belgacom.net/>'. Below this, it instructs the user to 'Enter the path and name, or browse to the location, of the upgrade file then click the APPLY button. You will be prompted to confirm the upgrade to complete the process.' There is a text input field labeled 'Firmware File' with a 'Browse...' button next to it. At the bottom right of the main area are three buttons: 'HELP', 'BEGIN UPGRADE', and 'CANCEL'.

Download the file to your hard drive. Then click Browse... to find the file on your computer. Select the firmware file and click 'Open.' Click 'BEGIN UPGRADE' to start the upgrade process.

Reset

Perform a reset from this page.

The screenshot shows the 'Reset' page within the 'ADVANCED SETUP' interface. The left navigation menu is the same as in the previous screenshot. The main content area has a title 'Reset' and a description: 'In the event that the system stops responding correctly or in some way stops functioning, you can perform a reset. Your settings will not be changed. To perform the reset, click on the APPLY button below. You will be asked to confirm your decision. The reset will be complete when the power light stops blinking.' At the bottom right of the main area are three buttons: 'HELP', 'REBOOT ROUTER', and 'CANCEL'.

Should your unit become unresponsive for any reason, you can simply perform a reset from this page. Performing a reset will reboot the device. Your configuration settings will remain the same.

Status

The Status screen displays WAN/LAN connection status, firmware and hardware version numbers, as well as information on DHCP clients connected to your network.

The security log may be saved to a file by clicking 'Save' and choosing a location. The following items are included on the Status screen:

Parameter	Description
INTERNET	Displays WAN connection type and status.
Release	Click on this button to disconnect from the WAN.
Renew	Click on this button to establish a connection to the WAN.
GATEWAY	Displays system IP settings, as well as DHCP Server and Firewall status
INFORMATION	Displays the number of attached clients, the firmware versions, the physical MAC address for each media interface and for the ADSL Modem Multiservices PSTN Voice, as well as the hardware version and serial number.
ATM PVC	Displays ATM connection type and status.
Security Log	Displays illegal attempts to access your network.
Save	Click on this button to save the security log file.
Clear	Click on this button to delete the access log.
Refresh	Click on this button to refresh the screen.
DHCP Client Log	Displays information on DHCP clients on your network.

This section describes common problems you may encounter and possible solutions to them. The ADSL Modem Multiservices PSTN Voice can be easily monitored through panel indicators to identify problems.

Problem	Solution
<i>LED Indicators</i>	
POWER LED is Off	<ul style="list-style-type: none"> • Check connections between the ADSL Modem Multiservices PSTN Voice, the external power supply, and the wall outlet. • If the power indicator does not turn on when the power cord is plugged in, you may have a problem with the power outlet, power cord, or external power supply. However, if the unit powers off after running for a while, check for loose power connections, power losses, or surges at the power outlet. If you still cannot isolate the problem, then the external power supply may be defective. In this case, contact Technical Support for assistance.
LAN LED is Off	<ul style="list-style-type: none"> • Verify that the ADSL Modem Multiservices PSTN Voice and attached device are powered on. • Be sure the cable is plugged into both the ADSL Modem Multiservices PSTN Voice and the corresponding device. • Verify that the proper cable type is used and that its length does not exceed the specified limits. • Be sure that the network interface on the attached device is configured for the proper communication speed and duplex mode. • Check the adapter on the attached device and cable connections for possible defects. Replace any defective adapter or cable if necessary.
<i>Network Connection Problems</i>	
Cannot ping the ADSL Modem Multiservices PSTN Voice from the attached LAN, or it cannot ping any device on the attached LAN	<ul style="list-style-type: none"> • Verify that the IP addresses are properly configured. For most applications, you should use the ADSL Modem Multiservices PSTN Voice's DHCP function to dynamically assign IP addresses to hosts on the attached LAN. However, if you manually configure IP addresses on the LAN, verify that the same network address (network component of the IP address) and subnet mask are used for both the ADSL Modem Multiservices PSTN Voice and any attached LAN devices. • Be sure the device you want to ping (or from which you are pinging) has been configured for TCP/IP.
<i>Management Problems</i>	
Cannot connect using the Web browser	<ul style="list-style-type: none"> • Be sure to have configured the ADSL Modem Multiservices PSTN Voice with a valid IP address, subnet mask, and default gateway. • Check that you have a valid network connection to the ADSL Modem Multiservices PSTN Voice and that the port you are using has not been disabled. • Check the network cabling between the management station and the ADSL Modem Multiservices PSTN Voice.
Forgot or lost the password	<ul style="list-style-type: none"> • Press the Reset button on the rear panel (holding it down for at least five seconds) to restore the factory defaults.

Glossary

10BASE-T

IEEE 802.3 specification for 10 Mbps Ethernet over two pairs of Category 3, 4, or 5 UTP cable.

100BASE-TX

IEEE 802.3u specification for 100 Mbps Fast Ethernet over two pairs of Category 5 UTP cable.

Auto-Negotiation

Signalling method allowing each node to select its optimum operational mode (e.g., 10 Mbps or 100 Mbps and half or full duplex) based on the capabilities of the node to which it is connected.

Bandwidth

The difference between the highest and lowest frequencies available for network signals. Also synonymous with wire speed, the actual speed of the data transmission along the cable.

Collision

A condition in which packets transmitted over the cable interfere with each other. Their interference makes both signals unintelligible.

Collision Domain

Single CSMA/CD LAN segment.

CSMA/CD

CSMA/CD (Carrier Sense Multiple Access/Collision Detect) is the communication method employed by Ethernet, Fast Ethernet, or Gigabit Ethernet.

End Station

A workstation, server, or other device that does not forward traffic.

Ethernet

A network communication system developed and standardized by DEC, Intel, and Xerox, using baseband transmission, CSMA/CD access, logical bus topology, and coaxial cable. The successor IEEE 802.3 standard provides for integration into the OSI model and extends the physical layer and media with repeaters and implementations that operate on fiber, thin coax and twisted-pair cable.

Fast Ethernet

A 100 Mbps network communication system based on Ethernet and the CSMA/CD access method.

Full Duplex

Transmission method that allows two network devices to transmit and receive concurrently, effectively doubling the bandwidth of that link.

IEEE

Institute of Electrical and Electronic Engineers.

IEEE 802.3

Defines carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications.

IEEE 802.3ab

Defines CSMA/CD access method and physical layer specifications for 1000BASE-T Fast Ethernet.

IEEE 802.3u

Defines CSMA/CD access method and physical layer specifications for 100BASE-TX Fast Ethernet.

IEEE 802.3x

Defines Ethernet frame start/stop requests and timers used for flow control on full-duplex links.

Local Area Network (LAN)

A group of interconnected computer and support devices.

LAN Segment

Separate LAN or collision domain.

LED

Light emitting diode used for monitoring a device or network condition.

Local Area Network

A group of interconnected computers and support devices.

Media Access Control (MAC)

A portion of the networking protocol that governs access to the transmission medium, facilitating the exchange of data between network nodes.

MIB

An acronym for Management Information Base. It is a set of database objects that contains information about the device.

RJ-45 Connector

A connector for twisted-pair wiring.

Straight-through Port

An RJ-45 port which does not cross the receive and transmit signals internally (MDI) so it can be connected with straight-through twisted-pair cable to any device having a crossover port (MDI-X). Also referred to as a 'Daisy-Chain' port. The RJ-45, 10/100 Mbps port supports Auto MDI/ MDI-X.

Switched Ports

Ports that are on separate collision domains or LAN segments.

UTP

Unshielded twisted-pair cable.
